A. Modular Block Units and Cap Blocks: Meet 28-day compressive strength of 4000 psi.
   1. Do not transport block units to the site until:
      a. A minimum 28-day compressive strength of 4000 psi has been achieved.
      b. Regardless of strength gain, do not transport block units to the site before seven days after fabrication.

B. All modular block facing units and cap blocks to be visually free of defects and will be rejected for not meeting any of the requirements specified in article 2.1. In addition, any of the following defects will be cause for rejection:
   1. Defects that indicate imperfect molding.
   2. Defects indicating honeycomb or other open-texture concrete .
   3. Cracked or severely chipped block units.
   4. Color variation on exposed face(s) of block unit due to excess form oil or other reasons.

PART 2 PRODUCTS

2.1 CONCRETE MODULAR BLOCK UNITS

A. Meet the following requirements for drycast concrete block units and cap blocks:

   1. Have a minimum 28-day compressive strength of 4,000 psi in accordance with ASTM C 140.
   2. Conform to ASTM C 1372, except as otherwise specified.
   3. Conform to the following freeze-thaw test requirements for the lot of block units produced for use in this project in accordance with ASTM C 1262.
      a. Minimum acceptable performance defined as weight loss at the conclusion of 150 freeze-thaw cycles not exceeding 1 percent of the block unit's initial weight for a minimum of 4 of the 5 block unit specimens tested.
      b. Per Engineer's approval, Project specific freeze-thaw durability tests may be substituted by the tests of units made with the same material, concrete mix design, manufacturing process, and curing method, conducted not more than 12 months prior to delivery. An independent laboratory to provide reports and certifications of the above tests as per ASTM C 1262 and C 1372 as appropriate.
   4. Have a maximum water absorption in accordance with ASTM C 140 no greater than 1 percent above the water absorption content of the lot of block units produced and successfully tested for the freeze-thaw test specified in item 3 above for all concrete block units.
   5. Conform to ASTM C 140 for testing of drycast concrete block units.

B. Manufactured using a combination of cement, aggregates, admixtures, and other constituents meeting the requirements of Section 03055.

1. Verify the compatibility of all components and with the environment in which the block will be used, including sulfate soils and/or groundwater.
2. Lightweight aggregates are subject to the Engineer's approval and must meet the requirements of ASTM C 331.

C. Provide block units with permissible variations of plus 0.12 inch and minus 0.06 inch.

D. Provide block units having angled sides capable of producing concave and convex alignment curves with a minimum radius of 3.3 feet.

E. Provide block units having a polymeric efflorescence control admixture.

F. Finish and Appearance
1. All units to be sound and free from cracks or other defects that would interfere with the proper placement of the unit or significantly impair the strength or permanence of the construction.
2. Minor cracks incidental to the usual method of manufacture or minor chipping resulting from shipment and delivery are not grounds for rejection.
3. Assure the exposed face or faces of units are free of chips, cracks or other imperfections when viewed from a distance of 30 feet under diffused lighting.
4. Up to five percent of a shipment may contain slight cracks or small chips not longer than 1 inch.

G. Notify the Engineer in writing at least 72 hours before beginning the casting of concrete modular block units.

H. Sampling
1. Acceptance of the concrete units with respect to compressive strength will be determined on a lot-by-lot basis.
   a. Randomly sample the lot in accordance with ASTM C 140. Core compressive strength test specimens or conform to the saw-cut coupons provisions of Section 5.2.4 of ASTM C 140. Refer to Table 1 for sampling frequency.

Table 1

Lot Size	**Samples**
0-8,000	3 units
Greater than 8,000	2 additional units per additional 8000

2. Provide additional samples if required by the Engineer.

I. Acceptance
   1. Units will be rejected for not meeting any of the requirements specified above. In addition, any of the following defects will be cause for rejection:
      a. Defects that indicate imperfect molding.
      b. Defects indicating honeycomb or open-texture concrete.
      c. Cracked or severely chipped units.
      d. Color variation on exposed face(s) of unit due to excess form oil or other reasons.

2.2 LEVELING PAD CONCRETE

A. Use Class AA, A or B concrete mixes in accordance with Section 03055.

2.3 MODULAR BLOCK-UNIT FILL

A. Use free-draining crushed stone, 3/8 to 3/4-inch within the modular block units requiring fill material.

2.4 REINFORCING ELEMENTS

A. Hot rolled from steel bars, galvanize coated 3.4 mils thick, meeting minimum requirements of ASTM D1784, Grade 65; AASHTO M-111 and ASTM A-123.

B. To be the specified size (see 02831S, article 1.1E-1) and free from defects.

2.5 REINFORCED WELDED WIRE MESH AND LOOP INBEDS

A. Meet minimum requirements of AASHTO M-32 and AASHTO M-55; and have galvanized coating 3.4 mils thick as per AASHTO M-111 (ASTM A-123).

2.6 FIBERGLASS AND STEEL PINS

A. Provide ½ inch diameter fiberglass connecting pins, where used, having a minimum flexural strength of 128 ksi and short beam shear of 6.5 ksi.

B. Provide steel connecting pins galvanized coated 3.4 mils thick, meeting Wall Company requirements.

2.7 OTHER FASTENERS

A. Fasteners to wingwalls and abutment wall, if required, to be provided by the selected Wall Company.

2.8 DAMAGED GALVANIZATION

A. Spray with zinc paint, covering the entire area that has been damaged, as an alternative to replacement of any reinforcing steel, reinforcing elements, wire mesh or fasteners that have damaged galvanization.

2.9 GEOTEXTILE

A. Cover horizontal and vertical joints between block units by a geotextile of the type and grade recommended by the Wall Company.

2.10 WALL CAP ADHESIVE

A. Use a medium-viscosity synthetic elastomeric polymer adhesive, such as “Titebond Heavy Duty Construction Adhesive”, or Engineer approved equivalent.

2.11 SELECT BACKFILL

A. Refer to Section 02832S- Select Backfill for MSE Walls.

PART 3 EXECUTION

3.1 GENERAL

A. Arrange for a qualified representative (minimum 5 years experience with MSE wall design and construction) from the selected Wall Company to be directly involved and provide technical assistance during all phases of construction of the wall(s).
   1. The Wall Company representative is to be at the project site for at least the first five working days of wall construction and until all aspects of wall construction have been satisfactorily demonstrated to the MSE Wall Company representative and the Engineer. The MSE Wall Company representative is to subsequently visit the site at least once every 10,000 sq. ft. of wall face construction, or as otherwise determined by the Engineer.
   2. The Wall Company representative is responsible for training the Contractor’s wall construction crew(s) and Department inspectors in proper quality control for construction of the walls.
      a. If one or more construction crew members change, the Wall Company representative is responsible to train the new crew member(s).
   3. During each site visit, the representative is to meet with the Engineer near the conclusion of the visit to report on the observed

wall construction procedures, including providing a copy of the field report.

B. Provide the Wall Company's construction manual to the Engineer, and assure that the wall system-specific requirements in the manual are integrated into the wall construction.

C. Provide a final field observations report from the Wall Company that specifically addresses that the completed wall(s) meet all Department and Wall Company specifications/requirements and what deficiencies exist, if any.
   1. Where the Department's and the Wall Company's specifications/requirements differ, the stricter of the two requirements applies.

D. Haul, store and ship wall materials so as to minimize the potential of producing any type of defects.

E. Perform excavation and foundation preparation (including removal of unsuitable soils) as described in Section 02832S.

F. Construct the wall system in accordance with the approved plans, this specification, and the Wall Company's recommendations and construction manual.

3.2 LEVELING PAD

A. Prepare the subgrade soils and/or fill so as to cast the leveling pad to the design elevations shown on the drawings to ensure complete contact of the retaining wall units with the base.

B. Place cast-in-place concrete leveling pad upon undisturbed in-situ soils or upon properly placed and compacted fill as per Section 02832S.

C. Place leveling pad to a minimum thickness of 6 inches.

D. Placement requirements in accordance with Section 03055.

E. Allow leveling pad to cure for at least 12 hours before placing modular block units.

3.3 MODULAR BLOCK UNIT INSTALLATION

A. Place wall backfill as described in Section 02832S.

B. Place the first course of modular block units on the leveling pad. Check the wall units for level and alignment. The first course is the most important to ensure accurate and acceptable results.

C. Ensure block units are in full contact with the leveling pad.

D. Install connecting devices in block units as required by the Wall Company.

E. For block units requiring fill material, fill all voids in block units with modular block unit fill. Tamp fill. Ensure each wall course is completely filled, backfilled, and compacted before proceeding to the next wall course.

F. Where connecting pins are used, lay up each course ensuring connecting pins protrude into adjoining courses above at least 1 inch.

G. Pull each block unit forward, away from the embankment, against connecting pins in the previous course and backfill as the course is completed. Repeat procedure to the extent of the wall height.

H. As appropriate where the wall changes elevation, the units can be stepped with grade or turned into the embankment with a convex return end. Provide appropriate buried units on the compacted leveling pad in the area of the convex return end.

I. Wall alignment tolerances.
1. Horizontal alignment: 0.7 percent (for example 2.5 inches in 30 feet).
2. Vertical tolerance: 0.7 percent (for example 0.85 inches in 10 feet).
3. Overall vertical tolerance of the wall (plumbness from top to bottom): 0.7 percent (for example 1.7 inches in 20 feet of wall height).
4. Levelness tolerance: 0.5 percent (for example 1.2 inches in 20 feet).

J. Install block units so that joints are uniform.
1. During construction the maximum allowable offset in any block joint is 0.25 inch.
2. Joint width is 0.50 inch maximum and 0.12 inch minimum.

3.4 STEEL SOIL REINFORCEMENT INSTALLATION

A. Lay the steel reinforcement horizontally on the compacted backfill at the proper elevations as designed.

B. Connect steel reinforcement to the block units as required by Wall Company.

C. Pull the reinforcement taut to eliminate any slack; then secure the back edge of the reinforcement before and during backfilling and compaction.

D. Assuming reinforcement is obstructed by elements such as piles, drilled shafts, guardrail posts, catch basins, drop inlets, culverts, etc. in the wall soil reinforcement zone, modify the reinforcement design using one of the following alternatives:
   1. If reinforcement is modified, design the surrounding reinforcement layers to carry the additional load.
   2 Place a structural frame around the obstruction which is capable of transferring loads from the reinforcements on one side of the obstruction to reinforcements on the other side of the obstruction.
   3. If the soil reinforcement consists of discrete strip or bar mats rather than continuous sheets, splay the reinforcements around the obstruction.

E. Place soil reinforcement normal to the face of the wall in plan view.
   1. Where required to splay the reinforcement around obstructions, skew the reinforcement (minimizing the skew angle to no more than 15 degrees).
   2. Maintain a set-back for reinforcement of at least 2 inches from piles or other metallic obstructions. Do not exceed horizontal spacing between longitudinal reinforcement of 7 feet.
   3. Separate any overlapping soil reinforcement elements with a minimum thickness of select backfill specified by the Wall Company.

3.5 WALL CAP INSTALLATION

A. Provide a permanent connection between the wall cap and the top course of the wall units using wall cap adhesive as described in article 2.10. Construct according to the Wall Company drawings and specifications.

3.6 CERTIFICATES OF COMPLIANCE

A. Furnish to the Engineer copies of the certificate of compliance for materials and the results of any tests performed.

SECTION 02836S

MSE WALLS USING MODULAR BLOCK UNITS AND GEOGRID REINFORCING ELEMENTS

Add Section 02836:

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Materials and construction requirements for mechanically stabilized earth (MSE) walls using a wall system (see Section 02831S) approved by the Engineer using modular block units for the wall face and geogrid reinforcing elements.

B. Provide and install modular block units, geogrid reinforcement, joint filler, and all necessary attachments from the selected Wall Company.

1.2 RELATED SECTIONS

A. Section 02831S: Retaining Wall-Alternate Systems

B. Section 02832S: Select Material for MSE Walls

C. Section 03055: Portland Cement Concrete

D. Section 03211: Reinforcing Steel and Welded Wire

E. Section 03310: Structural Concrete

1.3 REFERENCES

A. ASTM C 140: Standard Test Methods for Sampling and Testing Concrete Masonry Units and Related Units

B. ASTM C 331: Standard Specification for Lightweight Aggregates for Concrete Masonry Units

C. ASTM C 1262: Standard Test Method for Evaluating the Freeze-Thaw Durability of Dry-Cast Segmental Retaining Wall Units and Related Concrete Units

D. ASTM C 1372: Standard Specification for Dry-Cast Segmental Retaining Wall Units

E. ASTM D 5262: Standard Test Method for Evaluating the Unconfined Tension Creep and Creep Rupture Behavior of Geosynthetics

F. ASTM D 6637: Standard Test Method for Determining Tensile Properties of Geogrids by the Single or Multi-rib Tensile Method

1.4 SUBMITTALS

A. Submit for acceptance at least 10 days before beginning manufacture of the concrete modular block units, a sample of the proposed block texture and at least three color samples of the proposed block units, matched to colors of local features or as otherwise indicated by the Engineer.

B. Provide the Engineer submittals in accordance with Section 02831S and the appropriate working drawings.

C. Do not start work on any wall until all required submittal items have been reviewed and approved by the Design-Builder's Engineers and all Department comments have been addressed.

D. Provide certificates of compliance from a UDOT-qualified testing lab, certifying that the select backfill, the modular block facing units, and the geogrid complies with this section, and the results of all tests performed for the tests described in this section.

E. Provide the Wall Company's construction manual for the specific wall system.

F. Certification from the Wall Company that the completed wall(s) meet all Department and Wall Company specifications/requirements for the specific wall system.
   1. Where the Department's and the Wall Company's specifications or requirements differ, apply the stricter of the two.

1.5 ACCEPTANCE

A. Modular Block Units and Cap Blocks: Meet 28-day compressive strength of 4000 psi.
   1. Do not transport block units to the site until:
      a. A minimum 28-day compressive strength of 4000 psi has been achieved
      b. Regardless of strength gain, do not transport block units to the site before seven days after fabrication.

B. All modular block facing units and cap blocks to be visually free of defects and will be rejected for not meeting any of the requirements specified in article 2.1. In addition, any of the following defects will be cause for rejection:
   1. Defects that indicate imperfect molding.
   2. Defects indicating honeycomb or other open-texture concrete .
   3. Cracked or severely chipped block units.
   4. Color variation on exposed face(s) of block unit due to excess form oil or other reasons.

C. Geogrid: Free of defects and will be rejected if it does not meet the requirements stated in article 2.3.

PART 2 PRODUCTS

2.1 CONCRETE MODULAR BLOCK UNITS

A. Meet the following requirements for drycast concrete modular block units and cap blocks:
   3. Have a minimum 28-day compressive strength of 4,000 psi in accordance with ASTM C 140.
   4. Conform to ASTM C 1372, except as otherwise specified.
   5. Conform to the following freeze-thaw test requirements for the lot of block units produced for use in this project in accordance with ASTM C 1262.
      a. Minimum acceptable performance defined as weight loss at the conclusion of 150 freeze-thaw cycles not exceeding 1 percent of the block unit's initial weight for a minimum of 4 of the 5 block unit specimens tested.
      b. Per Engineer's approval, Project specific freeze-thaw durability tests may be substituted by the tests of units made with the same material, concrete mix design, manufacturing process, and curing method, conducted not more than 12 months prior to delivery. An independent laboratory to provide reports and certifications of the above tests as per ASTM C 1262 and C 1372 as appropriate.
   4. Have a maximum water absorption in accordance with ASTM C 140 no greater than 1 percent above the water absorption content of the lot of block units produced and successfully tested for the freeze-thaw test specified in item 3 above for all concrete block units.
   5. Conform to ASTM C 140 for testing of drycast concrete block units.

B. Provide concrete block manufactured using a combination of cement, aggregates, admixtures, and other components meeting the requirements of Section 03055.
   1. Verify the compatibility of all components and the environment in which the block will be used, including sulfate soils and/or groundwater.
   2. Lightweight aggregates are subject to the Engineer's approval and must meet the requirements of ASTM C 331.

C. Provide block units with permissible variations of plus 0.12 inch and minus 0.06 inch.

D. Provide block units having angled sides capable of producing concave and convex alignment curves with a minimum radius of 4 feet.

E. Provide block units having a polymeric efflorescence control admixture.

F. Finish and Appearance
   1. All block units to be sound and free from cracks or other defects that would interfere with the proper placement of the unit or significantly impair the strength or permanence of the construction.
   2. Minor cracks incidental to the usual method of manufacture or minor chipping resulting from shipment and delivery are not grounds for rejection.
   3. Assure the exposed face or faces of units are free of chips, cracks or other imperfections when viewed from a distance of 30 feet under diffused lighting.
   4. Up to five percent of a shipment may contain slight cracks or small chips not longer than 1 inch.
   5. The faces of the exposed corner facing block units to have the same approved architectural finish as the main face.

G. Notify the Engineer in writing at least 72 hours before beginning the casting of concrete modular block units.

H. Sampling
   1. Acceptance of the block units with respect to compressive strength will be determined on a lot-by-lot basis.
      a. Randomly sample the lot in accordance with ASTM C 140. Core compressive strength test specimens or conform to the saw-cut coupons provisions of Section 5.2.4 of ASTM C 140. Refer to Table 1 for sampling frequency.

Table 1

Lot Size	Samples
0-8,000	3 units
Greater than 8,000	2 additional units per additional 8000

2. Provide additional samples if required by the Engineer.

2.2 LEVELING PAD CONCRETE

A. Use Class AA, A ,or B concrete mix as per Section 03055.

2.3 GEOGRID

A. Use geogrid consisting of a regular grid network of integrally connected, discontinuous, select high-density polyethylene, polypropylene resin polymer or polyester tensile elements (specified for wall system selected) with aperture geometry sufficient to permit significant mechanical interlock with the surrounding soil and/or rock.
   1. Geogrid structure to be dimensionally stable and be able to retain its geometry under manufacture, transport, and installation.

B. Provide creep rupture test for 75-year design life per ASTM D5262.

C. Provide ultimate strength, minimum per ASTM D6637 and utilize geogrid reinforcement reduction factors as appropriate for the Project.

D. Inspect all soil reinforcement and attachment devices to ensure they are true to size and free from defects that may impair their strength and durability.

E. Prevent mud, wet concrete, epoxy and similar contaminants from coming in contact with and affixing to the soil reinforcement and inserts, that would interfere with the geogrid connections.

F. Store soil reinforcement products as recommended by the Wall Company.

2.4 FIBERGLASS PINS

A. If required, provide ½-inch diameter fiberglass connecting pins having a minimum flexural strength of 128 ksi and short beam shear of 6.5 ksi.

2.5 OTHER FASTENERS

A. If required, provide fasteners to wingwalls and abutment wall from the selected Wall Company.

2.6 SELECT BACKFILL

A. Refer to Section 02832S- Select Backfill for MSE Walls.

2.7 MODULAR BLOCK UNIT FILL

A. Use free-draining crushed stone, predominantly 3/8 to 3/4-inch, with no more than 5 percent passing the No 200 sieve, within the modular block units requiring fill material.

2.8 GEOTEXTILE

A. Cover horizontal and vertical joints between block units by a geotextile of the type and grade as recommended by the Wall Company.

2.9 WALL CAP ADHESIVE

A. Use a medium-viscosity synthetic elastomeric polymer adhesive, such as “Titebond Heavy Duty Construction Adhesive”, or Engineer-approved equivalent.

PART 3 EXECUTION

3.1 GENERAL

A. Arrange for a qualified representative (minimum 5 years experience with MSE wall design and construction) from the selected Wall Company to be directly involved and provide technical assistance during all phases of construction of the wall(s).
   1. The Wall Company representative is to be at the project site for at least the first five working days of wall construction and until all aspects of wall construction have been satisfactorily demonstrated to the MSE Wall Company representative and the Engineer. The MSE Wall Company representative is to subsequently visit the site at least once every 10,000 sq ft of wall face construction, or as otherwise determined by the Engineer.
   2. The Wall Company representative is responsible for training the Contractor’s wall construction crew(s) and Department inspectors in proper quality control for construction of the walls.
      a. If one or more construction crew members change, the Wall Company representative is responsible to train the new crew member(s).
   3. During each site visit, the representative is to meet with the Engineer near the conclusion of the visit to report on the observed

wall construction procedures, including providing a copy of the field report.

B. Provide the Wall Company's construction manual to the Engineer, and assure that the wall system-specific requirements in the manual are integrated into the wall construction.

C. Provide a final field observations report from the Wall Company that specifically addresses that the completed wall(s) meet all Department and Wall Company specifications/requirements and what deficiencies exist, if any.
   1. Where the Department's and the Wall Company's specifications/requirements differ, apply the stricter of the two requirements.

D. Perform excavation and foundation preparation (including removal of unsuitable soils) as described in Section 02832S.

E. Construct the wall system in accordance with the approved plans, this specification, and the Wall Company's recommendations and construction manual.

3.2 LEVELING PAD

A. Prepare the subgrade soils and/or fill so as to cast the leveling pad to the design elevations shown on the drawings, to ensure complete contact of the retaining wall units with the base.

B. Place cast-in-place concrete leveling pad as per Section 03055 upon undisturbed in-situ soils, or upon properly placed and compacted fill as per Section 02832S.

C. Place leveling pad to a minimum thickness of 6 inches.

D. Placement requirements in accordance with Section 03055.

E. Allow leveling pad to cure for at least 12 hours before placing modular block units.

3.3 MODULAR BLOCK UNIT INSTALLATION

A. Place wall backfill as described in Section 02832S.

B. Place the first course of modular block units on the leveling pad. Check the wall units for level and alignment. The first course is the most important to ensure accurate and acceptable results.

C. Ensure block units are in full contact with the leveling pad.

D. Install connecting devices in block units if required by the Wall Company.

E. For block units requiring fill material, fill all voids in block units with modular block unit fill. Tamp fill. Ensure each wall course is completely filled, backfilled, and compacted before proceeding to the next wall course.

F. Where connecting pins are used, ensure connecting pins protrude into adjoining courses above at least 1 inch.

G. Pull each block unit forward, away from the embankment, against connecting devices in the previous course and backfill as the course is completed. Repeat procedure to the extent of the wall height.

H. As appropriate where the wall changes elevation, the units can be stepped with grade or turned into the embankment with a convex return end. Provide appropriate buried units on the compacted leveling pad in the area of the convex return end.

I. Wall alignment tolerances.
1. Horizontal alignment: 0.7 percent (for example 2.5 inches in 30 feet).
2. Vertical tolerance: 0.7 percent (for example 0.85 inches in 10 feet).
3. Overall vertical tolerance of the wall (plumbness from top to bottom): 0.7 percent (for example 1.7 inches in 20 feet of wall height).
4. Levelness tolerance: 0.5 percent (for example 1.2 inches in 20 feet).

J. All joints to be uniform.
1. During construction the maximum allowable offset in any block joint is 0.25 inch.
2. Joint width is 0.50 inch maximum and 0.12 inch minimum.

3.4 GEOGRID INSTALLATION

A. Verify the correct orientation (roll direction) of the geogrid.

B. Lay the geogrid soil reinforcement horizontally on the compacted backfill at the proper elevations as designed.

C. Connect geogrid to the concrete wall units as required by Wall Company.

D. Pull the geogrid taut to eliminate loose folds and removing slack in the geogrid at the wall unit connections, pretension the geogrid, and then stake or otherwise secure the back edge of the geogrid before and during backfill and compaction.

E. Follow the Wall Company's guidelines relative to overlap requirements of uniaxial and biaxial geogrid.
   1. Assuming reinforcement is obstructed by elements such as piles, drilled shafts, guardrail posts, catch basins, drop inlets, culverts, etc. in the wall soil reinforcement zone, modify the reinforcement design using one of the following alternatives:
   2. If reinforcement is modified, design the surrounding reinforcement layers to carry the additional load.
   3. Place a structural frame around the obstruction which is capable of transferring loads from the reinforcements on one side of the obstruction to reinforcements on the other side of the obstruction.

3.5 WALL CAP INSTALLATION

A. Provide a permanent connection between the wall cap and the top course of the block units using wall cap adhesive as described in article 2.9. Construct according to the Wall Company drawings and specifications.

3.6 CERTIFICATES OF COMPLIANCE

A. Furnish to the Engineer copies of the certificate of compliance for materials and the results of any tests performed.

SECTION 02837S

TWO-STAGE MSE WALLS USING CONCRETE FACING PANELS AND METAL REINFORCING ELEMENTS

Add Section 02837S:

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Materials and construction requirements for two-stage mechanically stabilized earth (MSE) walls using a wall system (refer to Section 02831S) approved by the Engineer using concrete facing panels and metal reinforcing elements.

B. Provide and install face panels, reinforcing steel, tie strips, fasteners, joint filler, select backfill, and all necessary attachments from the selected Wall Company.

1.2 RELATED SECTIONS

A. Section 02831S: Retaining Wall-Alternate Systems

B. Section 02832S: Select Backfill for MSE Walls

C. Section 03055: Portland Cement Concrete

F. ASTM A 1011: Standard Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, and Ultra-High Strength

G. UDOT Quality Management Plans

1.4 SUBMITTALS

A. Submit sample of the texture of the panel face for the Engineer's approval.

B. Provide submittals in accordance with Section 02831S and working drawings including design details which protect the reinforcement connections from corrosion.

C. Do not start work on any wall until working drawings have been reviewed and approved by the Design-Builder's Engineers and all Department comments have been addressed.

D. Certificate of compliance for incorporated materials along with copies of results of any tests performed.

E. Wall Company's construction manual for the specific wall system.

F. Certification from the Wall Company that the completed wall(s) meet all Department and Wall Company specifications/requirements for the specific wall system.
   1. Where the Department's and the Wall Company's specifications or requirements differ, apply the stricter of the two.

1.5 ACCEPTANCE

A. Panel Acceptance
   1. Meet 28-day minimum compressive strength of 4000 psi.
   2. Do not transport panels to the site before seven days after fabrication and until:
      a. A minimum 28-day compressive strength of 4000 psi has been achieved, or

b. A minimum compressive strength of 3000 psi has been achieved at 14 days.

3. All panels to be visually free of defects and will be rejected if they:
   a. Do not meet the above requirements.
   b. Contain defects due to imperfect molding.
   c. Have any honeycomb.
   d. Have open texture on front face.
   e. Have cracks or spalls that exceed the limits specified in article 3.4

PART 2 PRODUCTS

2.1 PRECAST CONCRETE WALL PANELS

A. Obtain approval from the Engineer for the architectural treatment for all MSE panel walls.

B. Concrete. Class AA(AE) per Section 03055 and Section 03310, having a minimum 28-day compressive strength of 4000 psi.

C. Reinforcing steel to have a minimum cover of 2.0 inches.

D. Casting
   1. Use only a UDOT qualified supplier for precast concrete panel fabrication in accordance with UDOT Precast/Prestressed Concrete Structures Quality Management Plan.
      a. Do not cast panels on site.
   2. Cast panels on a flat area or approved architectural treatment, with the front face down.
      a. Set tie strip guides at back face.
   3. Place concrete in each unit without interruption.
      a. Vibrate with approved equipment to prevent stone pockets or cleavage planes.
      b. Use clean, unused form oil.

E. Reinforcement Connections
   1. Cast at least two soil reinforcement connection levels into all concrete panels.
      a. Where only two connection levels are cast in panels, locate the levels in two different horizontal planes separated by at least one-third the panel height.

F. Curing
   1. Keep surfaces wet and moist until the curing compound is applied.

2. Complete all patching or surface finishing before applying compound.
3. Spray the entire surface of the concrete with a membrane curing compound. Apply the curing compound at a uniform rate of 1.25 oz/ft^2.
4. Immediately re-spray any membrane damage which occurs during the curing period.
5. Leave forms in place until they can be removed without damage to the unit.

G. Concrete Finish
1. Provide a Class 1 finish for front face of panels.
   a. The thickness of the architectural treatment is in addition to the required design thickness.
2. Provide a uniform surface finish for the back face of panels.
   a. Roughly screen the finish to eliminate open pockets of aggregate and surface distortions in excess of 1/4 inch.

H. Tolerances
4. All dimensions ± 1/8 inch.
5. Angular distortion with regard to the height of panel not to exceed 3/16 inch in 5 feet.
6. Surface defects on form surfaces not more than 1/8 inch in 5 feet.

I. Marking
1. Mark the date of manufacture and panel-type designation on the rear of each panel so that it is legible during installation.

2.2 REINFORCING STEEL

A. Epoxy coated in accordance with Section 03211.

2.3 LEVELING PAD CONCRETE

A. Class A or Class B concrete mixes in accordance with Section 03055.

2.4 REINFORCING ELEMENTS

A. Hot rolled from steel bars, galvanize coated 3.4 mils thick, meeting minimum requirements of ASTM A 572, Grade 65; AASHTO M 111.

B. All reinforcing elements to be the specified size and free from defects.

2.5 REINFORCED WELDED WIRE MESH AND LOOP INBEDS

A. Meet minimum requirements of Section 03211 with galvanized coating at least 3.4 mils thick.

2.6 WIRE FACING UNITS

A. Wire facing units to be shop fabricated of cold-drawn steel wire conforming to the minimum requirements of AASHTO M-32 (ASTM A-182) and welded into the finished configuration in accordance with AASHTO M-55 (ASTM A-185). Galvanizing to conform to the minimum requirements of AASHTO M-111 (ASTM A-123).

2.7 TIE STRIPS

A. Shop fabricated, hot rolled steel conforming to minimum requirements of ASTM A 709M, Grade 345; AASHTO M 111; and ASTM A 1011 Grade 345 or equivalent, galvanize coated at least 3.4 mils thick.

2.8 PANEL FASTENERS

A. Bolts and nuts to be hexagonal cap screw and galvanize coated, meeting minimum requirements of ASTM A 325 and AASHTO M 232.

2.9 OTHER FASTENERS

A. Fasteners to wingwalls and abutment walls, if required, to be provided by the Wall Company.

2.10 CONNECTOR RODS

A. Connector rods to be fabricated from cold-drawn steel wire conforming to the minimum requirements of AASHTO M-32 (ASTM A-82); and be galvanized in accordance with AASHTO M-111 (ASTM A-123).

2.11 HAIRPIN CONNECTORS

A. Hairpin connectors to be shop fabricated of hot-rolled steel conforming to the minimum requirements of ASTM A-572, Grade 345 or equivalent; and be galvanized in accordance with AASHTO M-111 (ASTM A-123).

2.12 DAMAGED GALVANIZATION

A. Spray with zinc paint, covering the entire area that has been damaged, as an alternative to replacement of any reinforcing steel, reinforcing elements, wire mesh or fasteners that have damaged galvanization.

2.13 CURING COMPOUND

A. Refer to Section 03390

2.14 GEOTEXTILE

A. Cover horizontal and vertical joints between panels, when required, by a geotextile of type and grade recommended by the Wall Company.

2.15 ADHESIVE

A. Per Wall Company's standard.

2.16 BEARING PADS

A. Horizontal rubber bearing pads to be of the type and grade recommended and supplied by the Wall Company.

2.17 LIFTING DEVICES

A. Per Wall Company's standard.

2.18 SELECT BACKFILL

A. Refer to Section 02832S.

2.19 MATERIALS FOR CRACK AND SPALL REPAIR

A. Refer to Section 03924.

PART 3 EXECUTION

3.1 GENERAL

A. Arrange for a qualified representative (minimum five years experience with MSE wall design and construction) from the selected Wall Company to be directly involved and provide technical assistance during all phases of construction of the wall(s).
   1. For both the first and second stage of wall construction, the Wall Company representative is to be at the project site for at least the first five working days of wall construction and until all aspects of wall construction have been satisfactorily demonstrated to the MSE Wall Company representative and the Engineer. The MSE Wall Company representative is to subsequently visit the site at least

once every 10,000 sq. ft. of wall face construction, or as otherwise determined by the Engineer.

2. The Wall Company representative is responsible for training the Contractor's wall construction crew(s) and Department inspectors in proper quality control for construction of the walls.
    a. If one or more construction crew members change, the Wall Company representative is responsible to train the new crew member(s).
3. During each site visit, the representative is to meet with the Engineer near the conclusion of the visit to report on the observed wall construction procedures, including providing a copy of the field report.

B. Provide the Wall Company's construction manual to the Engineer, and assure that the wall system-specific requirements in the manual are integrated into the wall construction.

C. Provide a final field observations report from the Wall Company that specifically addresses that the completed wall(s) meet all Department and Wall Company specifications/requirements and what deficiencies exist, if any.
1. Where the Department's and the Wall Company's specifications/requirements differ, apply the stricter of the two requirements.

D. Haul, store, and ship wall materials so as to minimize the potential of producing any type of defects.
1. Store panels to avoid damage to connection pieces such that the tie strips do not bend.

E. Perform excavation and foundation preparation (including removal of unsuitable soils) as specified in Section 02832S.

F. Construct wall system in accordance with the approved plans, specifications, and the Wall Company's recommendations and construction manual.

3.2 LEVELING PAD

A. Prepare the subgrade soils and/or fill so as to cast the leveling pad or reinforced concrete footing to the design elevations shown on the drawings and to ensure complete contact of the retaining wall units with the base.

B. Furnish and place concrete in accordance with Section 03055.

C. Place cast-in-place concrete leveling pad upon undisturbed in-situ soils, or upon properly placed and compacted fill as per Section 02832S. Place leveling pad to a thickness of at least 6 inches after the required settlement has been achieved following the first-stage wall construction.

D. Allow leveling pad to cure for at least 12 hours before placing concrete panels.

3.3 WALL CONSTRUCTION

A. Place wall backfill and reinforcement for two-stage MSE walls as specified in Section 02832S, and in the Wall Company's Approved-for-Construction drawings.

B. Backfill the void behind the first-stage facing by placing the backfill in two approximately equal lifts, and compacting with lightweight equipment in accordance with Section 02832S.

C. Placement of Select Material as wall backfill to closely follow the erection of each course of wire facing units.

D. Place backfill in such a manner as to avoid any damage or disturbance to the wall materials or misalignment of the wire facing units.

E. Where reinforcement is obstructed by elements such as piles, drilled shafts, guardrail posts, catch basins, drop inlets, culverts, etc. in the wall soil reinforcement zone, modify the reinforcement design using one of the following alternatives:

1. If the reinforcement is modified, design the surrounding reinforcement layers to carry the additional load.
2. Place a structural frame around the obstruction which is capable of transferring loads from the reinforcements on one side of the obstruction to reinforcements on the other side of the obstruction.
3. If the soil reinforcement consists of discrete strips or bar mats rather than continuous sheets, splay the reinforcement around the obstruction.

F. Place soil reinforcement elements normal to the face of the wall in plan view.

1. Where required to splay the reinforcement around obstructions, skew the reinforcement (minimizing the skew angle to no more than 15 degrees).
   a. Maintain a set-back for reinforcement of at least 2 inches from piles or other metallic obstructions.

2. Do not exceed horizontal spacing between longitudinal reinforcing of 7 feet.
3. Separate any overlapping soil reinforcing elements with a minimum thickness of select backfill specified by the Wall Company.

G. Where reinforcement elements are to be connected using bolts and nuts, use a crescent or socket-head ratchet wrench to securely hand-tighten the nut.
   1. Do not use pneumatic equipment.

H. Construct the first-stage facing within 2 inches of the design vertical and horizontal alignments (excluding bulging).

I. Prevent significant bulging of the first-stage facing between reinforcing layers.
   1. Where bulging exceeds 3 inches between reinforcing layers, remove and reconstruct this portion of the wall.
   2. Bulging will be measured by a plumb straight-edge, or by using a plumb-bob string held in front of the wall face.
   3. The bulge measurement is the difference in the horizontal measurement from the straight edge or plumb-bob string to the location of maximum bulge and the reinforcement layer immediately above or below the budge (whichever is greater).

J. Proceed with placement of the second stage wall panels after confirmation is given by the Engineer that the required settlement has been achieved.

K. Handle panels by means of lifting device set into upper edge of the panels and set in position vertically.

L. Place bearing pads as required by the Wall Company to prevent concrete-to-concrete contact between panels.

M. Use rubber, wood, or metal shims as necessary to make final adjustments to the wall panel to facilitate level placement of the panel.
   1. Do not leave wood shims at any location.

N. Construct to and maintain wall facing tolerances as follows:
   1. Horizontal alignment: 0.7 percent (for example 2.5 inches in 30 feet)
   2. Vertical tolerance: 0.7 percent (for example 0.85 inches in 10 feet)
   3. Overall vertical tolerance (plumbness from top to bottom): 0.7 percent (for example 1.7 inches in 20 feet of wall height)
   4. Levelness: 0.5 percent (for example 1.2 inches in 20 feet)

O. Install panels so that joints are uniform. The maximum allowable offset in any panel joint is 0.40 inch. Joint width is 1.2 inches maximum and 0.50 inch minimum.

P. Check panel tolerance and reset before placement of the next panel if out of tolerance.

3.4 CRACK AND SPALL REPAIR CRITERIA FOR CONCRETE PANELS

G. A fully penetrating crack is defined as a crack extending through the cross-section of the precast panel from the front face to the back face of the unit.

H. Cracks at Front Face of Panel:
1. Panels with one or two partially penetrating cracks with widths less than or equal to 12 mils are acceptable.
2. Reject panels with fully penetrating cracks, or cracks wider than 12 mils.
3. No more than two cracks per individual panel are allowed without further evaluation.

I. Cracks at Back Face of Panel:
1. Partially penetrating cracks with widths less than or equal to 12 mils are acceptable.
2. Partially penetrating cracks with widths between 12 mils and 30 mils are acceptable when repaired with surface sealant according to subparagraph F, Crack Repair Procedures.
3. Evaluate partially penetrating cracks wider than 30 mils for acceptance with epoxy injection according to subparagraph F, Crack Repair Procedures.
4. No more than two repairable cracks per individual panel are allowed without further evaluation.

J. Spalls at Front Face of Panel:
1. Spalls with widths less than 4.0 inches and depths less than 2.0 inches may be repaired with a patching material acceptable to the Engineer of the same color as panel concrete. Resultant repair to be approved by the Engineer.
2. Reject panels with spalls wider than 4.0 inches or deeper than 2.0 inches.
3. Measure spall depth from the structural thickness of the panel excluding architectural surface finish.
4. Panels with more than two spalls are subject to further evaluation before acceptance.

K. Spalls at Back Face of Panel:

1. Spalls with widths less than 4.0 inches and depths less than 2.0 inches may be repaired with a patching material acceptable to the Engineer. Resultant repair to be approved by the Engineer.
2. Reject panels with spalls wider than 4.0 inches or deeper than 2.0 inches.
3. Panels with more than four spalls are subject to further evaluation before acceptance.

L. Crack Repair Procedures:

1. Surface Sealing: Prepare surface and apply a sealant acceptable to the Engineer according to Manufacturer's instructions.
2. Epoxy Injection: Prepare surface and inject cracks with Department-approved product according to Manufacturer's instructions.

G. Spall Repair Procedures:

1. Prepare surface and apply patching material according to Manufacturer's instructions, and as acceptable to the Engineer.

END OF SECTION

SECTION 02838S

TWO-STAGE MSE WALLS USING CONCRETE FACING PANELS AND GEOGRID REINFORCING ELEMENTS

Add Section 02838S:

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Materials and construction requirements for two-stage mechanically stabilized earth (MSE) walls using a wall system (refer to Section 02831S) approved by the Engineer using concrete facing panels and geogrid reinforcing elements.

B. Provide and install face panels, reinforcing steel, geogrid, fasteners, joint filler, select backfill, and all necessary attachments from the selected Wall Company.

1.2 RELATED SECTIONS

A. Section 02831S: Retaining Wall-Alternate Systems

B. Section 02832S: Select Backfill for MSE Walls

C. Section 03055: Portland Cement Concrete

D. Section 03211: Reinforcing Steel and Welded Wire

E. Section 03310: Structural Concrete

F. Section 03390: Concrete Curing

G. Section 03924: Epoxy Injection and Sealing

K. UDOT Quality Management Plans

1.4 SUBMITTALS

A. Submit sample of the texture of the panel face for the Engineer's approval.

B. Provide submittals in accordance with Section 02831S and working drawings including design details.

C. Do not start work on any wall until working drawings have been reviewed and approved by the Design-Builder's Engineers and all Department comments have been addressed.

D. Certificate of compliance for incorporated materials along with copies of results of any tests performed.

E. Wall Company's construction manual for the specific wall system.

F. Certification from the Wall Company that the completed wall(s) meet all Department and Wall Company specifications/requirements for the specific wall system.
   1. Where the Department's and the Wall Company's specifications or requirements differ, apply the stricter of the two.

1.5 ACCEPTANCE

A. Panel Acceptance
   1. Meet 28-day minimum compressive strength of 4000 psi.
   2. Do not transport panels to the site before seven days after fabrication and until:
      a. A minimum 28-day compressive strength of 4000 psi has been achieved, or
      b. A minimum compressive strength of 3000 psi has been achieved at 14 days.
   3. All panels to be visually free of defects and will be rejected if they:
      a. Do not meet the above requirements.
      b. Contain defects due to imperfect molding.
      c. Have any honeycomb.
      d. Have open texture on front face.
      e. Have cracks or spalls that exceed the limits specified in article 3.4

PART 2 PRODUCTS

2.1 PRECAST CONCRETE WALL PANELS

A. Obtain approval from the Engineer for the architectural treatment for all MSE panel walls.

B. Concrete. Class AA(AE) per Section 03055 and Section 03310, having a minimum 28-day compressive strength of 4000 psi.

C. Reinforcing steel to have a minimum cover of 2.0 inches.

D. Casting
   1. Use only a UDOT qualified supplier for precast concrete panel fabrication in accordance with UDOT Precast/Prestressed Concrete Structures Quality Management Plan.
      a. Do not cast panels on site.
   2. Cast panels on a flat area or approved architectural treatment, with the front face down.
      a. Set tie strip guides at back face.
   3. Place concrete in each unit without interruption.
      a. Vibrate with approved equipment to prevent stone pockets or cleavage planes.
      b. Use clean, unused form oil.

E. Reinforcement Connections

1. Cast at least two soil reinforcement connection levels into all concrete panels.
    a. Where only two connection levels are cast in panels, locate the levels in two different horizontal planes separated by at least one-third the panel height.

F. Curing
1. Keep surfaces wet and moist until the curing compound is applied.
2. Complete all patching or surface finishing before applying compound.
3. Spray the entire surface of the concrete with a membrane curing compound. Apply the curing compound at a uniform rate of 1.25 oz/ft^2.
4. Immediately re-spray any membrane damage which occurs during the curing period.
5. Leave forms in place until they can be removed without damage to the unit.

G. Concrete Finish
1. Provide a Class 1 finish for front face of panels.
    a. The thickness of the architectural treatment is in addition to the required design thickness.
2. Provide a uniform surface finish for the back face of panels.
    a. Roughly screen the finish to eliminate open pockets of aggregate and surface distortions in excess of 1/4 inch.

H. Tolerances
7. All dimensions ± 1/8 inch.
8. Angular distortion with regard to the height of panel not to exceed 3/16 inch in 5 feet.
9. Surface defects on form surfaces not more than 1/8 inch in 5 feet.

I. Marking
1. Mark the date of manufacture and panel type designation on the rear of each panel so that it is legible during installation.

2.2 REINFORCING STEEL

A. Epoxy coated in accordance with Section 03211.

2.3 LEVELING PAD CONCRETE

A. Class A or Class B concrete in accordance with Section 03055.

2.4 GEOGRID

A. Use geogrid consisting of a regular grid network of integrally connected, select high-density polyethylene or polypropylene resin polymer tensile elements.
   1. Aperture geometry sufficient to permit significant mechanical interlock with the surrounding soil and/or rock.
   2. Structure to be dimensionally stable and be able to retain its geometry under manufacture, transport, and installation.

B. Provide creep rupture test for 75-year design life per ASTM D5262.

C. Provide ultimate strength, minimum per ASTM D6637 and utilize geogrid reinforcement reduction factors as appropriate for the Project.

D. Carefully inspect all soil reinforcement and attachment devices to ensure they are true to size and free from defects.

E. Prevent mud, wet concrete, epoxy, and other contaminants from coming in contact with and affixing to the soil reinforcement and inserts, that would interfere with the geogrid connections.

F. Store soil reinforcement products as recommended by the wall company.

2.5 REINFORCED WELDED WIRE MESH AND LOOP INBEDS

A. Meet minimum requirements of Section 03211 with galvanized coating at least 3.4 mils thick.

2.6 WIRE FACING UNITS

A. Wire facing units to be shop fabricated of cold-drawn steel wire conforming to the minimum requirements of AASHTO M-32 (ASTM A-182) and welded into the finished configuration in accordance with AASHTO M-55 (ASTM A-185). Galvanizing to conform to the minimum requirements of AASHTO M-111 (ASTM A-123).

2.7 FASTENERS

A. Fasteners to wingwalls and abutment walls, if required, to be provided by the Wall Company.

2.8 CONNECTOR RODS

A. If steel connector rods are required, fabricate from cold-drawn steel wire conforming to the minimum requirements of AASHTO M-32 (ASTM A-82); and be galvanized in accordance with AASHTO M-111 (ASTM A-123).

2.9 HAIRPIN CONNECTORS

A. If steel hairpin connectors are required, shop fabricate hot-rolled steel conforming to the minimum requirements of ASTM A-572, Grade 345 or equivalent; and be galvanized in accordance with AASHTO M-111 (ASTM A-123).

2.10 DAMAGED GALVANIZATION

A. Spray with zinc paint, covering the entire area that has been damaged, as an alternative to replacement of any reinforcing steel, wire mesh or fasteners that have damaged galvanization.

2.11 CURING COMPOUND

A. Refer to Section 03390

2.12 GEOTEXTILE

A. Cover horizontal and vertical joints between panels, when required, by a geotextile of type and grade recommended by the Wall Company.

2.13 ADHESIVE

A. Per Wall Company's standard.

2.14 BEARING PADS

A. Horizontal rubber bearing pads to be of the type and grade recommended and supplied by the Wall Company.

2.15 LIFTING DEVICES

A. Per Wall Company’s standard.

2.16 SELECT BACKFILL

A. Refer to Section 02832S.

2.17 MATERIALS FOR CRACK AND SPALL REPAIR

A. Refer to Section 03924.

PART 3 EXECUTION

3.1 GENERAL

A. Arrange for a qualified representative (minimum five years experience with MSE wall design and construction) from the selected wall company to be directly involved and provide technical assistance during all phases of construction of the wall(s).
   1. For both the first and second stage of wall construction, the wall company representative is to be at the project site for at least the first five working days of wall construction and until all aspects of wall construction have been satisfactorily demonstrated to the MSE wall company representative and the Engineer. The MSE wall company representative is to subsequently visit the site at least once every 10,000 sq. ft. of wall face construction, or as otherwise determined by the Engineer.
   2. The wall company representative is responsible for training the Contractor's wall construction crew(s) and Department inspectors in proper quality control for construction of the walls.
      a. If one or more construction crew members change, the wall company representative is responsible to train the new crew member(s).
   3. During each site visit, the representative is to meet with the Engineer near the conclusion of the visit to report on the observed wall construction procedures, including providing a copy of the field report.

B. Provide the wall company's construction manual to the Engineer, and assure that the wall system-specific requirements in the manual are integrated into the wall construction.

C. Provide a final field observation report from the wall company that specifically addresses that the completed wall(s) meet all Department and wall company specifications/requirements and what deficiencies exist, if any.
   1. Where the Department's and the wall company's specifications/requirements differ, apply the stricter of the two requirements.

D. Haul, store, and ship wall materials so as to minimize the potential of producing any type of defects.
   1. Store panels to avoid damage to connection pieces, such that the tie strips do not bend.

E. Perform excavation and foundation preparation (including removal of unsuitable soils) as specified in Section 02832S.

F. Construct wall system in accordance with the approved plans, specifications, and the wall company's recommendations and construction manual.

3.2 LEVELING PAD

A. Prepare the subgrade soils and/or fill so as to cast the leveling pad or reinforced concrete footing to the design elevations shown on the drawings and to ensure complete contact of the retaining wall units with the base.

B. Furnish and place concrete in accordance with Section 03055.

C. Place cast-in-place concrete leveling pad upon undisturbed in-situ soils, or upon properly placed and compacted fill as per Section 02832S. Place leveling pad to a thickness of at least 6 inches after the required settlement has been achieved following the first-stage wall construction.

D. Allow leveling pad to cure for at least 12 hours before placing concrete panels.

3.3 GEOGRID INSTALLATION

A. Verify the correct orientation (roll direction) of the geogrid.

B. Place geogrid horizontally on the compacted backfill at the proper design.

C. Connect geogrid to the first-stage facing as specified by the wall company.

D. Pull the geogrid taut to eliminate loose folds and remove slack in the geogrid at the wire facing connections, pretension the geogrid, and stake or otherwise secure the back edge of the geogrid before and during backfill and compaction.

E. Follow the wall company's overlap requirements for uniaxial and biaxial geogrids.

F. Where reinforcement is obstructed by elements such as piles, drilled shafts, guardrail posts, catch basins, drop inlets, culverts, etc. in the wall soil reinforcement zone, modify the reinforcement design using one of the following alternatives:

4. If the reinforcement is modified, design the surrounding reinforcement layers to carry the additional load.

5. Place a structural frame around the obstruction which is capable of transferring loads from the reinforcements on one side of the obstruction to reinforcements on the other side of the obstruction.

3.4 WALL CONSTRUCTION

A. Place wall backfill and reinforcement for two-stage MSE walls as specified in Section 02832S, and in the Wall Company's Approved-for-Construction drawings.

B. Backfill the void behind the first-stage facing by placing the backfill in two approximately equal lifts, and compacting with lightweight equipment in accordance with Section 02832S.

C. Placement of Select Material as wall backfill to closely follow the erection of each course of wire facing units.

D. Place backfill in such a manner as to avoid any damage or disturbance to the wall materials or misalignment of the wire facing.

E. Construct the first-stage facing within 2 inches of the design vertical and horizontal alignments (excluding bulging).

F. Prevent significant bulging of the first-stage facing between reinforcing layers.
   1. Where bulging exceeds 3 inches between reinforcing layers, remove and reconstruct this portion of the wall.
   2. Bulging will be measured by a plumb straight-edge, or by using a plumb-bob string held in front of the wall face.
   3. The bulge measurement is the difference in the horizontal measurement from the straight edge or plumb-bob string to the location of maximum bulge and the reinforcement layer immediately above or below the budge (whichever is greater).

G. Proceed with placement of the second stage wall panels after confirmation is given by the Engineer that the required settlement has been achieved.

H. Handle panels by means of lifting device set into upper edge or side of the panels and set in position vertically.

I. Place bearing pads as required by the Wall Company to prevent concrete-to-concrete contact between panels.

J. Use rubber, wood, or metal shims as necessary to make final adjustments to the wall panel to facilitate level placement of the panel.
   1. Do not leave wood shims at any location.

K. Construct to and maintain wall facing tolerances as follows:
   3. Horizontal alignment: 0.7 percent (for example 2.5 inches in 30 feet)
   4. Vertical tolerance: 0.7 percent (for example 0.85 inches in 10 feet)
   3. Overall vertical tolerance (plumbness from top to bottom): 0.7 percent (for example 1.7 inches in 20 feet of wall height)
   4. Levelness: 0.5 percent (for example 1.2 inches in 20 feet)

L. Install panels so that joints are uniform. The maximum allowable offset in any panel joint is 0.40 inch. Joint width is 1.0 inch maximum and 0.50 inch minimum.

M. Check panel tolerance and reset before placement of the next panel if out of tolerance.

3.4 CRACK AND SPALL REPAIR CRITERIA FOR CONCRETE PANELS

A. A fully penetrating crack is defined as a crack extending through the cross-section of the precast panel from the front face to the back face of the unit.

B. Cracks at Front Face of Panel:
   4. Panels with one or two partially penetrating cracks with widths less than or equal to 12 mils are acceptable.
   5. Reject panels with fully penetrating cracks, or cracks wider than 12 mils.
   6. No more than two cracks per individual panel are allowed without further evaluation.

C. Cracks at Back Face of Panel:
   5. Partially penetrating cracks with widths less than or equal to 12 mils are acceptable.
   6. Partially penetrating cracks with widths between 12 mils and 30 mils are acceptable when repaired with surface sealant according to subparagraph F, Crack Repair Procedures.
   7. Evaluate partially penetrating cracks wider than 30 mils for acceptance with epoxy injection according to subparagraph F, Crack Repair Procedures.
   8. No more than two repairable cracks per individual panel are allowed without further evaluation.

D. Spalls at Front Face of Panel:
   5. Spalls with widths less than 4.0 inches and depths less than 2.0 inches may be repaired with a patching material acceptable to the

Engineer of the same color as panel concrete. Resultant repair to be approved by the Engineer.

6. Reject panels with spalls wider than 4.0 inches or deeper than 2.0 inches.
7. Measure spall depth from the structural thickness of the panel excluding architectural surface finish.
8. Panels with more than two spalls are subject to further evaluation before acceptance.

E. Spalls at Back Face of Panel:

4. Spalls with widths less than 4.0 inches and depths less than 2.0 inches may be repaired with a patching material acceptable to the Engineer. Resultant repair to be approved by the Engineer.
5. Reject panels with spalls wider than 4.0 inches or deeper than 2.0 inches.
6. Panels with more than four spalls are subject to further evaluation before acceptance.

F. Crack Repair Procedures:

3. Surface Sealing: Prepare surface and apply a sealant acceptable to the Engineer according to Manufacturer's instructions.
4. Epoxy Injection: Prepare surface and inject cracks with Department-approved product according to Manufacturer's instructions.

G. Spall Repair Procedures:

1. Prepare surface and apply patching material according to Manufacturer's instructions, and as acceptable to the Engineer.

END OF SECTION

SECTION 02839S

PREFABRICATED MODULAR GRAVITY WALL (PMGW) SYSTEMS USING LARGE MODULAR BLOCK UNITS

Add Section 02839S:

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Materials and construction requirements for PMGW walls as specified in Section 02831S.

B. Provide and install the prefabricated modular gravity block wall units and all necessary appurtenances from the selected Wall Company.

B. ASTM C331: Lightweight Aggregates for Concrete Masonry Units

C. ASTM D412: Vulcanized Rubber and Thermoplastic Elastomers-Tension

D. ASTM D1248: Polyethylene Plastics Extrusion Materials For Wire and Cable

E. ASTM D3034: Type PSM Poly (Vinyl Chloride) (PVC) Sewer Pipe and Fittings

F. American Association of State Highway and Transportation Officials (AASHTO) LRFD Bridge Design Specifications

G. National Concrete Masonry Association (NCMA):
   1. NCMA SRWU-1 Test Method for Determining Connection Strength of SRW
   2. NCMA SRWU-2 Test Method for Determining Shear Strength of SRW

1.4 SUBMITTALS

A. Submit sample of the texture for the Engineer's approval.

B. Submit for approval at least 3 color samples of proposed segmental concrete unit colors (if integral color is required), matched to colors of local features or as otherwise indicated, at least four weeks before beginning manufacture of the block units.

C. Provide working drawings and other applicable submittals in accordance with Section 02831S.

D. Do not start work on any wall until working drawings have been reviewed and approved by the Design-Builder's Engineers and all Department comments have been addressed.

E. Certificate of compliance for incorporated materials along with copies of results of any tests performed.

F. Certification from the Wall Company that the completed wall(s) meet all Department and Wall Company specifications.
   1. Where the Department's and the Wall Company's specifications differ, the stricter of the two apply.

1.5 ACCEPTANCE

A. Prefabricated Modular Gravity Block Units:
   1. Compressive Strength: Minimum 28-day of 4000 psi. Modular gravity block units which meet 75 percent of 28-day strength within 7 days are acceptable for placement in the wall.
      a. Acceptance is determined on a lot basis.
      b. The lot will be randomly sampled in accordance with ASTM Specification C140.
      c. Test specimens will be cored or conform to the saw-cut coupons provisions of ASTM Specification C140, Section 6.2.4.
      d. Block sampling frequency:

Table 1

Lot Size	**Samples**
0-2,000	4 units
Greater than 2,000	1 unit per 1,000

e. Provide additional samples if requested by the Engineer.

2. Dimension Tolerances:
   a. Height: +/- 3/16”
   b. Width: +/- 1/2” unless field cut for fitting purposes.
   c. Depth: No less than the unit design depth of the blocks.

3. Finish and Appearance:
   a. Modular gravity block units to be sound, free from visual defects, and free from cracks or other defects that interfere with the proper placement of the unit or impair the strength or durability of the construction.
   b. Assure the exposed face or faces of units are free of chips, cracks, or other imperfections when viewed from a distance of 30 feet under diffused lighting.
   c. Acceptance will be at the Engineer’s discretion.
   d. Up to five percent of a shipment may contain slight cracks or small chips not longer than 1 inch.

4. Block units will be rejected for failure to meet any of the above specified requirements. In addition, units will be rejected for any of the following defects:
   a. Defects that indicate imperfect molding
   b. Defects indicating honeycomb or open-texture concrete
   c. Cracked or severely chipped units
   d. Color variation on exposed face(s) of unit

B. Completed Wall Construction Tolerances:
   1. Horizontal alignment (including curves and corners) is 0.7 percent (for example 2.5 inches in 30 feet).
   2. Adjacent block tolerance is 1 percent (for example 0.4 inches in 3 feet).
   3. The overall vertical tolerance of the wall (plumbness from top to bottom) not to exceed 1 percent (for example 0.8 inches in 6 feet of wall height).
   4. Level tolerance not to exceed 0.5 percent (for example 1.2 inches in 20 feet).
   5. Ensure all joints are uniform. Maximum allowable offset in any block joint is 0.5 inch. Maximum joint width is 0.25 inch.

PART 2 PRODUCTS

2.1 CONCRETE MODULAR BLOCK UNITS

A. Concrete. Class AA(AE) per Section 03055 and Section 03310, having a minimum 28-day compressive strength of at least 4000 psi.

B. Manufacture concrete block using a combination of cement, aggregates, admixtures, and other components meeting the requirements of Section 03055.
   1. Verify the compatibility of all components and the environment in which the block will be used, including sulfate soils and/or groundwater.
   2. Lightweight aggregates are subject to the Engineer's approval and meet the requirements of ASTM C331.

C. Provide block units having angled sides capable of producing concave and convex alignment curves with a minimum radius as specified in the Wall Company's layout drawings.

D. Notify the Engineer in writing at least 72 hours before beginning the casting of concrete modular block units.

2.2 ADHESIVE

A. Use a urethane or polyurethane adhesive which is specifically described as forming a bond with concrete and masonry materials. Minimum tensile stress of 225 psi and minimum elongation of 600% (ASTM D412).
   1. Product examples meeting these criteria are Sikabond Construction Adhesive and Geocel 3500.

2.3 DRAINAGE PIPE

A. If required in Construction Drawings, use perforated or slotted PVC drainage pipe manufactured in accordance with ASTM D3034 or corrugated HDPE pipe manufactured in accordance with ASTM D1248.

2.4 SELECT MATERIAL FOR PMGW

A. Use Select Material for PMGW which is free from frozen, organic and otherwise deleterious materials.

B. Conform to the following gradation limits as determined by AASHTO T-27 / ASTM D422:

Table 2

Gradation for Select Material for PMGW Walls	
Sieve Size	**Percent passing**
2 inch	100
¾ inch	75-100
No. 4	0-60
No. 40	0-30
No. 200	0-5

C. Use Select Material for PMGW that:
   1. Is substantially free of shale or other soft, poor durability particles.
   2. Has an organic content less than 1 percent as determined by AASHTO T-267 on the portion of the material finer than the No. 10 sieve.

D. Furnish the Engineer with a copy of all test results performed to meet the requirements of this section of the specification.

PART 3 EXECUTION

3.1 GENERAL

A. Arrange for a qualified representative (minimum five years experience with PMGW wall design and construction) from the selected Wall Company to be directly involved and provide technical assistance during all phases of construction of the wall(s).
   1. The Wall Company representative is to be at the project site for at least the first five working days of wall construction and until all aspects of wall construction have been satisfactorily demonstrated to the PMGW Wall Company representative and the Engineer. The PMGW Wall Company representative is to subsequently visit the site at least once every 10,000 sq. ft. of wall face construction, or as otherwise determined by the Engineer.
   2. The Wall Company representative is responsible for training the Contractor's wall construction crew(s) and Department inspectors in proper quality control for construction of the walls.
      a. If one or more construction crew members change, the Wall Company representative is responsible to train the new crew member(s).
   3. During each site visit, the representative is to meet with the Engineer near the conclusion of the visit to report on the observed wall construction procedures, including providing a copy of the field report.

B. Provide the Wall Company's construction manual to the Engineer, and assure that the wall system-specific requirements in the manual are integrated into the wall construction.

C. Provide a final field observations report from the Wall Company that specifically addresses that the completed wall(s) meet all Department and Wall Company specifications/requirements and what deficiencies exist, if any.
   1. Where the Department's and the Wall Company's specifications/ requirements differ, the stricter of the two requirements applies.

D. Haul, store, and ship wall materials to minimize the potential of producing any type of defects.

E. Perform excavation and foundation preparation (including removal of unsuitable soils) as specified in Section 02317.

F. Construct the wall system in accordance with the approved plans, specifications, and the Wall Company's recommendations and construction manual.

G. Do not place any block until it has been cured for at least 7 days and meets all acceptance criteria.

3.2 LEVELING PAD INSTALLATION

A. Prepare the subgrade soils and/or fill to install the leveling pad to the design elevations shown on the drawings, to ensure complete contact of the retaining wall units with the base so that there are no voids beneath or between units.
   1. Remove all foundation soils found to be unsuitable and replace with Select Material for PMGW placed and compacted as described in this Section.

B. Place Select Material for PMGW leveling pad to a thickness of at least 6 inches on undisturbed in-situ soils or on properly placed and compacted fill as per this Section.

C. Provide a level surface on which to place the first course of block units.

D. Width of the leveling pad extends at least 6 inches in front and 6 inches in back of the base unit footprint.

E. Compact leveling pad material in accordance with Section 02056 so as to provide a smooth, hard surface on which to place the first course of units.

3.3 PMGW BLOCK UNIT INSTALLATION

A. Make the width of excavation equal to or exceeding the required backfill. Refer to the approved plans for backfill dimensions from the back face of the wall.

B. Place the first course of modular block units on the leveling pad. Verify that the wall units are level and properly aligned.

C. Ensure block units are in full contact with the leveling pad.

D. Place unit faces in contact end to end. Do not allow any gaps one-half inch or greater.

E. Follow erection of each course of wall blocks with placement of Select Material for PMGW. Complete backfill at the front of the wall prior to backfilling more than 4 feet above the bottom of the lowermost facing block.
   1. Minimum bury depth of the bottom block is 1.0 ft.
   2. Do not damage, disturb or misalign block units during backfill placement.
   3. Do not exceed individual block height (loose) in lift thickness. Decrease the lift thickness as necessary to obtain the specified density. Place backfill in uniformly thick layers.

F. Ensure each wall course is completely filled, backfilled, and compacted before proceeding to the next wall course.
   1. Compact backfill to at least 95 percent of the maximum density, AASHTO T-99, Method C or D (with oversized correction, outlined in Note 7 of T-99).
   2. Place and compact each layer of backfill in a level manner before placing subsequent backfill layers.

G. Lay each successive course making sure that the bottom recess is in full contact with the unit locators of the course below. Pull unit forward as far as possible.

H. Check and maintain level and wall batter. Do not use shims.

I. Clean the top of each course before setting additional courses.

J. At the end of each day's operation, slope the backfill away from the wall to direct runoff of rainwater away from the wall face.
   1. Do not allow surface runoff from adjacent areas to enter the wall construction site.

3.4 WALL CAP INSTALLATION

A. Provide a permanent connection between the wall cap and the top course of the wall units. Construct according to the Wall Company's drawings and specifications.
   1. Use a urethane or polyurethane adhesive which is specifically described as forming an excellent bond with concrete and masonry materials.
      a. Minimum tensile stress of 225 psi (ASTM D412).
      b. Minimum elongation of 600% (ASTM D412).

B. Clean and apply exterior concrete cap adhesive to top course of wall units before placement of cap unit.

C. Trim sides of interior cap units to insure proper fit of wall cap. Do not leave cut surfaces exposed to view in the finished wall.

D. Fill and compact soil to finished grade.

END OF SECTION

SECTION 02845S

MEDIAN REFLECTORS

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Materials and construction requirements for median reflectors.

1.2 RELATED SECTIONS Not Used

1.3 REFERENCES Not Used

1.4 DEFINITIONS Not Used

1.5 SUBMITTALS

A. Submit manufacturer's specifications and product information to Engineer for approval prior to ordering median reflectors.

PART 2 PRODUCTS

2.1 MEDIAN REFLECTOR

A. Use a reflector product that is designed for use as a raised pavement marker that will not break or detach from the surface under normal traffic loading conditions.

B. Use a product that provides adequate retroreflectivity to be easily seen by approaching traffic in all approaching lanes. Use yellow reflectors.

2.2 CONSTRUCTION ADHESIVE

A. Use construction adhesive that meets the recommendation of the reflector manufacturer. Adhesive should create a permanent bond with the concrete curb surface that will not become dislodged under normal roadway conditions including rain, snow, and ice.

PART 3 EXECUTION

3.1 MEDIAN REFLECTOR

A. Place median reflectors per manufacturer's recommendations.

B. Place median reflectors so that reflectors are aligned with the direction of oncoming lanes in both directions.

C. Install reflectors within one foot of the object marker signs on the ends of the raised medians between the plowable end sections and the signs, then install reflectors at even spacing along raised median curbing with a maximum spacing of 50 feet and a minimum spacing of 40 feet.

D. Place two additional pavement markers at intersecting streets and driveways spaced 12 inches apart located at approximately the center of the approaching lane of the cross street. Align these reflectors toward the cross street approaching traffic

SECTION 02871S

SOIL NAIL RETAINING WALLS

Add Section 02871:

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Requirements for the design and construction of permanent soil nail retaining walls.

B. All labor, materials, and equipment to complete the work, including the following:
1. Excavate in staged lifts
2. Drill soil nail drill holes
3. Install soil nail bars with centralizers
4. Grout soil nails
5. Supply and install specified drainage features
6. Supply and install bearing plates, washers, nuts, and other required hardware
7. Construct the initial and final soil nail wall facing.

C. Monitoring and control of deformations of the soil nail wall, surrounding ground, utilities, and other facilities existing at the time of construction.

D. Requirements for verification and proof tests including, load schedules, expected soil grout bond strengths, frequency of tests, and testing equipment.

1.2 RELATED SECTIONS

A. Section 02342S: Shotcrete

B. Section 03055: Portland Cement Concrete

C. Section 03211: Reinforcing Steel

V. FHWA Geotechnical Engineering Circular No. 7: Soil Nail Walls - Reference Manual, Report No. FHWA-NHI-14-007, February 2015 (FHWA GEC7)

1.4 DEFINITIONS

A. Soil Nail Bar: Generic term referring to a reinforcing bar grouted into a drilled hole installed in the ground.

B. Soil Nail Retaining Wall: An earth-retaining structure built from the top down in existing ground using steel reinforcement grouted into the ground to reinforce the earth adjacent to the excavation with a reinforced shotcrete facing.

C. Soil Nailing Work: Includes, but is not limited to, excavation according to the phasing shown in the Contractor's accepted plans; drilling soil nail holes to the specified length and orientation; providing, placing, and grouting soil nail bars into the drill holes; testing installed bars; installing wall drainage elements; placing shotcrete reinforcement, applying shotcrete facing over the reinforcement; attaching bearing plates and nuts; conducting soil nail testing; placing the final structural and architectural facing, and installing instrumentation.

D. Soil Nail Designer: Professional Engineer licensed in the State of Utah having the required experience in design of soil nail walls, and retained by the Design-Builder to design the soil nail wall system and provide soil nail design services during construction of the system.

E. Solid Bar Soil Nail (SBSN): Soil nail with solid steel reinforcing bar, installed by placing bar in a drilled hole then grouted.

F. Hollow Bar Soil Nail (HBSN): Hollow core and self-drilling bar advanced into the soil by drilling with a sacrificial bit as grout is injected through the bar.

G. Facing and Wall Drainage Work: Includes, but is not limited to, furnishing all materials and labor necessary for placing and securing geocomposite drainage material, connection pipes, footing drains, weep holes, and horizontal drains, drainage gutter, permanent facing, leveling pads, and connectors, and free-draining granular backfill.

H. Working Drawings: Plans produced by the Contractor that supplement the contract plans to provide information not included in the contract documents, but that is required to fabricate, erect, transport or temporarily support the structure or structural elements in the completion of the work.
   1. Working drawings do not supersede the contract plans.

I. Bird's Beak: The spaces above the bottom elevations of the inclined drill hole openings at the face of the wall after grout placement.

1.5 SUBMITTALS

A. Submit all soil nail working drawings and other design and construction submittals outlined below to the Design-Builder's Structural and Geotechnical Engineers, as well as to the Department.
   1. Where the requirements below indicate that a submittal is for approval, obtain the written approval of the Design-Builder's Structural and Geotechnical Engineers prior to proceeding with the work.
   2. In all cases, address to the Engineer's satisfaction any comments provided by the Department, prior to proceeding with the work.

B. At least 30 days before the planned start of wall excavation, submit for approval the Soil Nail Contractor Qualifications, including:
   1. The company name.
   2. List of at least three projects in the last five years demonstrating successful construction of permanent soil nail retaining walls totaling at least 10,000 ft^2 of wall face area and at least 500 permanent soil nails. Include the following for each project:
      a. Project name and location.
      b. Owner's name and current phone number.
      c. A brief description of the scope of work and approximate date of the project completion.
      d. List of any planned subcontractors for design or construction.
   3. List of the following personnel and their experience with permanently anchored or nailed structures:
      a. Supervising engineer
      b. Drill operators
      c. On-site supervisors assigned to the project.
   4. Written documentation of the shotcrete finisher's and nozzlemen's qualifications including proof of ACI Shotcrete Nozzleman certification for approval at least seven days before beginning wall excavation.
   5. Use only those individuals meeting experience requirements for this project.

a. Do not substitute for these individuals without written approval.
b. Suspend soil nailing work if the Contractor substitutes unapproved project personnel for approved personnel.
c. Contractor is fully liable for all additional costs and schedule impacts resulting from work suspension due to substitution of unapproved personnel.

C. At least 30 days before planned start of wall excavation, submit for approval the Soil Nail Designer Qualifications, including:
1. The company name.
2. List of at least three projects in the last five years demonstrating successful design of permanent soil nail retaining walls, including:
   a. Project names and locations.
   b. Owner's names and current phone numbers.
   c. Brief descriptions of the scope of work and approximate completion dates for each project.
3. The name of the Soil Nail Designer and professional engineer licensing information.
4. Use only those individuals meeting experience requirements for this project.
5. Do not substitute for these individuals without written approval.
   a. Suspend work if Contractor substitutes unapproved project personnel for approved personnel.
   b. Contractor is fully liable for all additional costs and schedule impacts resulting from work suspension due to substitution of unapproved personnel.

D. Site Survey Information
1. Provide necessary survey and alignment control for the excavation of each lift, location of drill holes, and verification of limits of soil nail wall construction.
2. Establish a pre-excavation baseline by making not less than one set of readings two weeks prior to soil nail wall excavation.
   a. Survey equipment to be capable of resolving vertical settlements of as little as 0.08 inches and lateral deflections to 0.04 inches.
   b. All readings to reference a fixed point or benchmark that will remain unaffected by excavation or other construction activities.
   c. Continue readings for at least two months following the completion of soil nail wall.
   d. Submit a report of the readings within 24 hours of obtaining the readings.

E. Working Drawings

1. At least 21 calendar days before the planned start of wall excavation, submit for approval Detailed Soil Nail Wall Drawings..
2. Verify the limits of the wall and ground survey data before preparing drawings.
3. Include the following in the drawings:
   a. Details, dimensions, quantities, ground profiles, utilities, existing structures, and cross-sections necessary to construct the wall.
   b. Specifications for all materials, procedures, and quality control applicable to the construction of the soil nail walls.
   c. Specifications for sacrificial verification nail testing (minimum of two nails per wall) and for proof testing of production nails, along with necessary detail drawings for the proposed jacking support, framing, and bracing to be used.
4. Provide a plan view of each wall that identifies the following:
   a. A reference baseline and elevation datum.
   b. The offset from the construction centerline or baseline to the face of the wall at its base at all changes in horizontal alignment.
   c. Beginning and end of wall stations.
   d. Right-of-way and permanent or temporary construction easement limits.
   e. Locations of all known active and abandoned existing utilities/structures or other potential interferences.
   f. The centerline of any drainage structure, sewer, or pipe behind, passing through, or passing under or over the wall.
   g. Details on how soil nail walls will avoid bridge abutment piles, if applicable.
   h. Limit of longest nails.
   i. Subsurface exploration logs, with locations shown on a plan view of the proposed wall alignment with appropriate reference base lines to fix the locations of the explorations relative to the wall.
5. Provide an elevation view of each wall that identifies the following:
   a. The elevation at the top of the wall, at all horizontal and vertical break points, and at least every 10 ft along the wall.
   b. Beginning and end of wall stations.
   c. The distance along the face of the wall to all steps in the wall base.
   d. Wall elevation view showing nail locations and elevations; vertical and horizontal nail spacing; and the location of wall drainage elements and permanent facing expansion/contraction joints (as required) along the wall length.
   e. Existing and finish grade profiles both behind and in front of the wall.

6. Include the following additional information and details:
   a. All necessary cross section(s) to construct the wall
   b. Elevations at the base of the wall and the top of leveling pads for casting CIP facing (if applicable).
   c. Design parameters and applicable codes.
   d. General notes for constructing the wall including construction sequencing or other special construction requirements.
   e. Horizontal and vertical curve data affecting the wall and wall control points. Match lines or other details to relate wall stationing to centerline stationing.
   f. A listing of the summary of quantities on the elevation drawing of each wall showing estimated square feet of wall face areas and other quantities.
   g. Soil nail wall typical sections including staged excavation lift elevations, wall and excavation face batter, nail spacing and inclination, nail bar sizes, and corrosion protection details.
   h. A typical detail of production and test nails defining the nail length, minimum drill hole diameter, inclination, and test nail bonded and unbonded test lengths.
   i. Details, dimensions, and schedules for all nails, reinforcing steel, wire mesh, bearing plates, headed studs, etc. and/or attachment devices for shotcrete.
   j. Details, dimensions, and schedules of all reinforcing steel including reinforcing bar bending details.
   k. Details and dimensions for wall appurtenances such as barriers, coping, drainage gutters, fences, etc.
   l. Details for terminating walls and adjacent slope construction.
   m. Method of soil nail corrosion protection.
   n. Facing finishes, color and architectural treatment requirements for permanent wall facing elements, if applicable.
7. Submit supporting engineering calculations, including the following:
   a. A written summary that describes the overall soil nail wall design.
   b. Applicable code requirements and design references.
   c. Design criteria including estimated soil shear strengths (friction angle and cohesion), unit weights, and ground-grout pullout resistances, steel resistances, shotcrete resistances, and nail drill hole diameter assumptions.
   d. Include data from any additional subsurface borings, laboratory work, or other subsurface data collected.
   e. Values and associated load factors used in design for pullout resistance, surcharges, soil/rock unit weights, nail head strengths, and strengths of steel, shotcrete, and concrete materials. Global stability and soil resistance/load factors used in LRFD verifications.

f. Design calculation sheets with the project number, wall location, designation, date of preparation, initials of designer and checker, and page number at the top of each page. Provide an index page with the design calculations.
g. An explanation of any symbols and computer programs used in the design.
h. Critical wall cross-section geometry including soil/rock strata and location, magnitude, and direction of slope or external surcharge loads, and piezometric levels (if applicable) with critical slip surface shown along with minimum calculated global stability soil factor of safety, and required nail lengths and strengths (nail bar sizes and grades) for each nail row.
i. Structural design calculations for wall facing and nail head/facing connections including consideration of facing flexural and punching shear strength, headed stud tensile strength, upper cantilever, minimum reinforcement ratio, cover and splice requirements.
j. Other design calculations including, but not limited to, soil nail wall stability at critical stages of construction under prevailing surcharge loads; external soil nail wall stability; and fill compaction criteria.

8. Prepare drawings according to the following:
   a. Submit drawings electronically in PDF format. Use 11 x 17 inch sheets with a 1½ inch blank margin on the left edge. Place the following information in the title block in the lower right corner of each sheet:
      1) State Project Designation
      2) State Project Name
      3) State Structure Number
      4) Contractor, Fabricator, or Erector Name
      5) Contractor, Fabricator, or Erector Drawing Number
      6) Contractor, Fabricator, or Erector Sheet Number
   b. Revise and resubmit drawings when directed by the Design-Builder's Engineers or when necessary to address Department comments.
   c. Provide the seal of a PE or SE licensed in the State of Utah.
9. Prepare engineering calculations according to the following:
   a. Submit calculations electronically in PDF format. Use 8½ x 11 inch sheets with a 1-inch blank margin on the left edge or 11 x 17 inch sheets with a 1½ inch blank margin on the left edge. Title block location is at the top of 8½ x 11 inch sheets or the lower right corner of 11 x 17 inch sheets. Place the following information in the title block:
      1) State Project Designation
      2) State Project Name
      3) State Structure Number

4) Contractor, Fabricator, or Erector Name
5) Contractor, Fabricator, or Erector Drawing Number
6) Contractor, Fabricator, or Erector Sheet Number

b. Provide the seal of a PE or SE licensed in the State of Utah on the cover sheet of all engineering calculations.
c. Certify that engineering calculations have been checked according to the Department QC/QA Procedures.

10. Allow at least 14 calendar days for review and approval of working drawings and supporting calculations.
    a. This review period applies each time the drawings and calculations are submitted.
11. Do not deviate from the approved drawings unless the deviation is recommended in writing by the Soil Nail Designer and authorized by the Engineer.
    a. Assume the responsibility for costs incurred due to faulty detailing or fabrication.
    b. Revise the drawings when plan dimensions are revised due to field conditions or for other reasons.

F. Submit As-Built Drawings within 30 days after completion of the work.
1. Provide the locations of the nails in the top row for each wall. Include Northings, Eastings, elevation, azimuth, and inclination (to the nearest 0.1 inch and 0.5 degrees).
2. Include survey datum.
3. Provide revised design calculations signed and sealed by a PE or SE licensed in the State of Utah for all design changes made during the construction of the wall.

G. At least 21 days before beginning wall excavation, submit for approval the Construction Plan, including the following:
1. Project start date and proposed detailed wall construction sequence and phasing plan.
2. Proposed methods to contain grout, shotcrete, and void-filling materials within the project area and the UDOT ROW.
3. Proposed drilling methods, equipment, and drill hole diameters.
4. Proposed methods of soil nail installation.
5. Shotcrete wet or dry-mix methods and procedures for placing shotcrete.
6. Monitoring and instrumentation plan indicating how the wall facing will be surveyed daily to monitor displacements. Include locations of measurement points and frequency and methods of measurement.
7. Procedures for placing nail grout, grout quality control plan, and equipment.

H. At least 14 days before beginning wall excavation, submit the following Equipment Calibration and quality control items:
   1. Calibration data for all testing equipment including load cells, test jacks, pressure gages, and grout pumps.
   2. Calibrations must have been performed by an independent testing lab within 60 days of the submittal date.
      a. Calibrate jack and pressure gage as a single unit.
      b. Include date tested, device identification number, and calibration results, certified with an accuracy of at least 2% of the applied certification loads by a qualified independent testing laboratory within 90 days of submittal.
      c. Testing may not be performed until the Design-Builder's Engineers approve the calibration reports.

I. Material Submittals
   1. Manufacturer's certificates of compliance, product data, specifications, and recommended installation instructions for furnished materials, including, but not limited to:
      a. soil nail bar ultimate strength
      b. soil nail bar yield strength
      c. welded wire reinforcement steel
      d. reinforcement steel
      e. couplers
      f. studded anchor plates
      g. epoxy coating
      h. encapsulation
      i. geocomposite drainage strip
      j. centralizers
      k. geotextiles
      l. prefabricated drain grates
   2. Nail grout mix design, including:
      a. Compressive strength test results, per AASHTO T106/ASTM C109, supplied by a qualified independent testing lab and verifying specified minimum 3-day and 28-day grout compressive strengths.
      b. Test nail grout at a frequency of no less than one test cube for every 50 cubic yards of grout placed.
         1) Report grout cube shrinkage.
         2) Provide grout cube test results within 24 hours of testing.
      c. For neat cement grout, include specific gravity test results of the fresh grout used for compressive testing.
   3. Shotcrete mix design with compressive strength test results.

J. Soil Nail Wall Verification and Proof Test Results
   1. Submit Verification and Proof test reports within 48 hours of the test.

2. Report failed Verification and Proof Nail test results immediately to the Engineer and the Soil Nail Designer, with the soil nail location, bonded and unbonded length, maximum load held, and the failure load.

K. Document the pre-construction condition of the site, existing structures and facilities before beginning any wall construction activity.
   1. During construction, observe the conditions above the soil nail wall on a daily basis for signs of ground movement in the vicinity of the wall.
   2. Immediately notify the Soil Nail Designer, the Design-Builder's Engineers, and the Engineer if signs of movement such as new cracks in structures, increased size of old cracks or separation of joints in structures, foundations, or paved and unpaved surfaces are observed.

L. Shotcrete production summary
   1. Prepare for each shift and submit within 24 hours.
   2. Include the following:
      a. Quantity and location of shotcrete applied including Sketches.
      b. Observations of success or problems of equipment operation, application, final product conditions, and any other relevant issues during production and application.
      c. Description of placement equipment.
      d. Batch number(s) if applicable

M. Shotcrete quality control records
   1. Submit field quality control test reports within 2 working days of performing the tests.
   2. Include the following:
      a. Sample identification, including mix design and test panel number and orientation.
      b. Date and time of sample preparation including sample dimensions.
      c. Date, time, and type of test.
      d. Complete test results including load and deformation data during testing, sketch of sample before and after testing, visual grade of cores, and any unusual occurrences observed.
      e. Names and signatures of people performing the test
      f. Location of steel reinforcement, if used, covered by shotcrete.
      g. Name of nozzle operator.

PART 2 PRODUCTS

2.1 SOIL NAILS AND HARDWARE

A. Provide fully threaded solid- or hollow-bars continuous with approved couplings, threaded to allow proper attachment of bearing plate, washer, and nut.
   1. SBSNs
      a. AASHTO M 31 Grade 75, or better, #7 solid threaded bar
   2. HBSNs
      a. Fully threaded hollow-steel tubing that serves as drilling steel, grout transfer medium, and reinforcing element of the soil nail.
      b. AASHTO M 31 Grade 75 or better, 0.60 in^2 minimum cross sectional area.
      c. Uniform elongation without necking $A_{gt} \geq 5\%$
      d. Minimum Charpy impact resistance of 40 Joules at -20 degrees C
      e. If required, provide bar couplers with seals or similar mechanism to ensure minimum grout loss and means of transferring percussive drilling forces.
      f. Select drill bits based on subsurface data and minimum grout column requirements, with a minimum of 2 ports for grout exit.

B. Provide bar couplings that develop the full nominal tensile capacity of the soil nail bar as certified by the manufacturer.

C. Provide the following corrosion protection methods:
   1. For SBSNs, use fusion-bonded epoxy-coated bars with 0.012 to 0.017 inch coating thickness.
      a. Conform to ASTM A775 but omit bend test requirements.
      b. The design may omit coating at the wall anchorage end over the length provided for threading the nut against the bearing plate.
      c. Zinc galvanized coating a minimum of 3.4-mil thick may be used in lieu of epoxy coating.
         1) Meet AASHTO M 111 for galvanized bars and AASHTO M 232 for galvanized hardware.
   2. For HBSNs, provide sacrificial steel in accordance with FHWA GEC 7.
   3. For all bars, provide at least 1.0 inch of grout cover between the soil nail bar and the surrounding soil.
   4. Store and protect all bars such that epoxy or galvanized coating and bar surface and threads are undamaged.

D. Centralizers
   1. For SBSNs, use centralizers manufactured from Schedule 20 or 40 PVC pipe securely attached to the soil nail bar with coated wire.
      a. Size centralizers to position the soil nail bar within 1.0 inch of the center of the drill hole
      b. Space centralizers no greater than 10 ft apart and 1.5 ft from the end of each nail.
      c. Use centralizers that allow tremie pipe insertion to the bottom of the hole, and to allow grout to freely flow up the hole.
   2. For HBSNs used in permanent applications, use steel centralizers attached to the bar in front of the couplings, at spacing no greater than 10 feet.

E. Provide nail grout consisting of neat cement or sand/cement mixture having a minimum 3-day compressive strength of 1,500 psi and a minimum 28-day compressive strength of 3,000 psi per AASHTO T 106, and specific gravity between 1.80 and 1.90.
   1. For SBSNs, use sand for grout and meeting requirements of ASTM C33.
   2. For HBSNs, do not use sand in the nail grout mix.
   3. Use Type II Portland Cement meeting AASHTO M 85.
   4. Admixtures may be used to control bleed, improve flowability, reduce water content, and/or retard set as specified in the accepted submittals.
      a. Use only admixtures that are compatible with the grout and mixed according to the manufacturer's recommendations.
      b. Do not use accelerators.
   5. Do not add water to grout conforming to the mix design to improve workability.
   6. Test grout specific gravity with a mud balance according to the procedure in ASTM D4380.
      a. Comply with any requests by the Engineer to test the grout with a mud balance at any time, particularly if the specific gravity appears to be less than 1.80.

2.2 SHOTCRETE

A. Use shotcrete conforming to Section 02342S.
   1. Produce shotcrete by either a wet-mix or dry-mix process.
   2. Apply shotcrete in one or more layers, pneumatically projected through a hose at high velocity against a prepared surface.

2.3 CONCRETE

A. Class AA(AE). Refer to Section 03055.

2.4 REINFORCING STEEL AND WELDED WIRE

A. Refer to Section 03211.

2.5 GEOCOMPOSITE DRAIN STRIP

A. Use a drainage strip consisting of a drainage core (e.g., geonet) and an attached or encapsulating filtration geotextile, with the drainage core meeting the following:
   1. At least 85% by mass polypropylenes, polyester, polyamine, polyvinyl chloride, polyolefin, or polystyrene.
   2. Compressive strength of at least 40 psi in accordance with ASTM D1621 Procedure A.
   3. Flow rate of at least 0.1 gallons per second per foot of strip width under a gradient of 1.0 tested in accordance with ASTM D4716.

B. Use Miradrain 6000, Amerdrain 500, or equivalent geocomposite drainage strip recommended by the Soil Nail Designer and accepted by the Engineer.

C. Provide drainage geotextile and geocomposite drain strips in rolls wrapped with a protective covering and labeled to identify the production run.
   1. Store/stockpile geotextiles and geocomposites in a manner which protects the fabric from mud, dirt, dust, debris, and shotcrete rebound.
   2. Do not remove the protective wrapping until immediately before material is installed.
      a. Avoid extended exposure to ultraviolet light.

2.6 UNDERDRAIN ELEMENTS

A. Use underdrain and perforated pipe meeting requirements of ASTM D1785 Schedule 40 PVC solid and perforated wall; cell classification 12454-B or 12454-C, wall thickness SDR 35, with solvent or elastomeric joints

B. Use fittings for underdrain and perforated pipe meeting requirements of ASTM D3034, cell classification 12454-B or 12454-C, wall thickness SDR-35, with solvent or elastomeric joints.

2.7 STUDDED ANCHOR PLATES

A. AASHTO M270, Grade 36. Refer to Section 05120.

B. Galvanize after fabrication according to AASHTO M 111.

2.8 ARCHITECTURAL SURFACE FINISH

A. Cast-in-place concrete or pre-cast concrete panels with formed surface texture meeting the project aesthetics plan.

2.9 EQUIPMENT

A. Equipment for mixing and placing grout shall have the following characteristics.
   1. Mix grout with a high-shear colloidal mixer with separate holding tank and water and cement dosing system to ensure continuous grouting independent from mixing.
   2. Minimum grout pump flow rate 15 gpm for bars < 2 inch diameter and 45 gpm for bars ≥ 2 inch diameter.
   3. Minimum grout pump pressure capability of 250 psi in sands/gravels and 1,500 psi in clays/silts.

B. For dry-mix shotcrete, provide a water storage tank at the job site and a positive displacement pump with regulating valve that is accurately controlled to provide water at the pressures and volumes recommended by the delivery machine manufacturer.

C. Use equipment capable of handling and applying shotcrete containing the specified maximum size aggregate and admixtures.

D. Provide and air hose and blow pipe to clear dust and rebound during shotcrete application.

E. Use an air supply system capable of supplying the delivery machine and hose with air at the pressures and volumes recommended by the machine manufacturer.
   1. Do not use air supply systems that are incapable maintaining constant air pressure or deliver oil-contaminated air measured as described in ASTM D 4285.

F. Use a shotcrete delivery machine capable of supplying material to the delivery hose at a uniform rate.
   1. The ejection from the nozzle must adhere to the treated surface with minimum rebound and maximum density when the nozzle is held in the range of 3-6 ft from the target surface.

PART 3 EXECUTION

3.1 SOIL NAIL WALL GENERAL REQUIREMENTS

A. Design and construct permanent soil nail retaining walls at the locations shown on the drawings.

B. Perform additional exploration and testing to supplement the Department-provided geotechnical data as deemed appropriate to complete final design.

3.2 SOIL NAIL WALL DESIGN REQUIREMENTS

A. Design the soil nail walls using the LRFD procedures contained in FHWA GEC 7.

B. Account for applicable traffic and construction equipment surcharge loads in the design.

C. Extend shotcrete and permanent facing at the toe of the walls to at least 2 ft below the finished grade at front face of wall at all points.

D. Provide a total reinforced structural concrete facing thickness of at least 10 inches, including initial shotcrete and final cast-in-place concrete facing (if used), but excluding precast facing panels and architectural relief.
   1. At a minimum, provide reinforcement in the structural concrete wall face consisting of No. 4 bars at 12-inch spacing in both directions.
      a. Supplement this minimum reinforcing with additional bars or with wire mesh as required by the design.

E. Provide expansion joints and contraction joints at appropriate intervals for the wall design, as specified in FHWA GEC 7.

F. Locate the top row of nails within 2 ft of the top of the wall.

G. Arrange soil nails so that the distance between the lower course of nails and the average base of the wall is less than two thirds of the average vertical nail spacing.

H. Provide a minimum design life of 75 years for the soil nail walls and all components, and include supporting data and calculations in the design submittal.

I. Perform the soil nail design to consider the locations of existing utilities or obstructions in the area of construction.

J. Wall locations and wall batter angles are shown on the plans.

1. The minimum permissible wall facing batter for the soil nail design is 2 degrees.

K. Provide backwall drainage through weep holes.
   1. Transmit backwall drainage down the wall through geotextile drainage mats.
   2. Drainage from multiple mats may be collected and conveyed to a single weep hole if the conduit is appropriately sized.

L. Include provisions to prevent concentrated flow over the top surface of the walls.

M. Design all soil nail walls to withstand seismic ground shaking having a 3% probability of exceedance in 75 years.

3.3 SOIL NAIL WALL CONSTRUCTION REQUIREMENTS

A. Excavation
   1. Do not exceed the short-term ground stand-up height or a distance equal to the vertical nail spacing plus the required reinforcing lap distance, whichever is less, for the exposed unsupported excavation face height.
      a. Flash coat exposed surface with up to 1” of shotcrete as required to maintain cut face stability where recommended by the Soil Nail Designer.
   2. Excavate the final wall excavation line and apply shotcrete during the same work shift, unless otherwise approved.

B. Soil Nail Installation
   1. Provide a soil nail length necessary to develop the load capacity and satisfy acceptance criteria for the required design load.
   2. Place soil nail drill holes at the locations, elevations, orientations, and lengths shown on the plans.
   3. Use drilling methods and equipment that are suited to the ground conditions and in accordance with the submittals.
   4. Use cased drilling methods or other suitable means to support the sides of the drill holes if needed.
   5. Replace soil nail bars exhibiting abrasions, cuts, welds, weld spatter, corrosion, or pitting.
   6. Replace or repair soil nail bars exhibiting damage to epoxy coating at no additional cost.
   7. Inspect epoxy coating on soil nail bars before insertion into the drill hole.

C. Install Soil Nails
   1. Conform to stationing and horizontal spacing shown on the plans.

2. Install top row of nails no more than 2 feet vertically from the design elevation of the finished soil nail retaining wall elevation.
a. Install subsequent rows at a maximum 4 feet vertical spacing under the bridge structure and under median, and a maximum 5 feet vertical spacing elsewere.
3. Install bottom row of nails a minimum of 2 feet and a maximum of 3 feet above the bottom of the excavation.
4. Eliminate bottom row of nails where second row from bottom is within 2 feet of the bottom of the excavation.
5. Horizontally stagger every other row of each column of nails midway between nail columns.
a. Maintain maximum horizontal spacings noted on plans.
6. Place soil nail bars within 6 inches of layout in any direction
7. Install nails to the lengths shown on the plans.
8. Maintain nail vertical inclination within 2 degrees of the inclination shown on plans.
9. Nails may be splayed up to 10 degrees horizontally to avoid obstructions such as piles, drainage features, utilities, etc.
a. Note location of splayed nails and reason for splay on working drawings.
10. Inform the Soil Nail Designer and the Engineer immediately if nails cannot be installed at plan locations.
a. Resolve conflicts as recommended in writing by the Soil Nail Designer after receiving authorization from the Engineer.

D. Grouting
1. Grout the drill hole after installation of the soil nail bar and within 2 hours of completing drilling.
2. Inject grout at the lowest point of each drill hole through a hollow bar soil nail, grout tube, casing, hollow-stem auger, or drill rods.
3. Place the outlet end of the grout delivery tube below the surface of the grout as the conduit is withdrawn to prevent the creation of voids.
4. Fill the drill hole in one continuous operation.
    a. Do not allow cold joints in the grout column except at the top of the test-bond length of proof-tested production nails.
5. For hollow-bar soil nails, use a high-shear colloidal mixer with a separate holding tank capable of continuous grouting that is independent from mixing.
    a. Minimum pump flow rate of 15 gpm.
6. Consider the hollow bar soil nails to be completed when the final grout returns to the excavation face, signaling that drilling spoils have been removed.
7. Fill bird’s beaks with additional grout after placing a temporary cover in front of the drill hole.
    a. Alternatively, fill bird’s beaks with shotcrete.

E. Soil Nail Testing

1. General
    a. Conduct verification tests on sacrificial nails at locations shown on the Nailing Pattern sheets in the plans.
    b. Perform proof testing on production soil nails.
        1. Test at least 5 percent of production soil nails, and
        2. Test no fewer than one production nail per row on each soil nail wall, and distribute the locations of proof tests evenly across the vertical and horizontal extent of the wall face.
    c. Perform testing at any nail after the nail grout and shotcrete facing have cured for at least 72 hours, or have attained their specified 3-day compressive strength.
    d. Do not apply loads greater than 80% of the minimum guaranteed ultimate tensile strength of the soil nail bar for Grade 150 bars, or 90% of the yield strength of the soil nail bar for minimum Grade 75 bars.
    e. Calculate nominal pullout resistance per unit length of soil nail utilizing a bond strength q_u of 16psi.
        1. Alternately calculate the design load DL based on the allowable design soil-grout adhesion bond strength of 8psi.
    f. Use Verification and Proof test nails having a minimum 3 feet unbonded length.
        1. Clean out the hollow bar unbonded length after bar installation.
        2. Placing a PVC pipe bond breaker without cleanout will not be sufficient to provide unbonded length.
    g. Measure and verify void for unbonded length prior to testing.
    h. Provide Verification test nails having a minimum 10-ft bonded length and Proof test nails having a minimum of 10 feet bonded length, unless tests are performed on production nails less than 12 feet in length.
2. Equipment
    a. Provide testing equipment including dial gages, dial gage support, jack and pressure gage, load cell, and a reaction frame as shown on plans.
    b. Use a pressure gage with a maximum graduation of 50 psi or use calibrated load cell for load steps.
    c. Support dial gages on a frame that is independent from the jacking and the wall.
    d. Measure nail head movement with at least 2 dial gages capable of measuring to 0.001 inch
3. Verification Testing

a. Perform the 2 verification tests per wall at locations shown on the plans.
b. Conduct on sacrificial nails prior to installation of production soil nails in order to confirm the appropriateness of the Contractor's drilling and installation methods and validate the design nail pullout resistance.
c. Conduct on nails of the same design and constructed with the same methods to be used on production nails.
d. Perform verification tests on soil nails with a known bonded length and a measured unbonded length.
e. Select a bonded length, L_{BVT}, as follows:
   1. Select L_{VBTmax}

      For Grade 75 or better, and other mild steel in accordance with ASTM A615, calculate the maximum length, L_{BVTmax} as

$$L_{BVT\,\max} = \frac{A_t \times f_y \times C_{RTY}}{r_{PO}} \qquad \text{EQ1}$$

      For Grade 150 and other high strength steel in accordance with ASTM A722, calculate the maximum length as

$$L_{BVT\,\max} = \frac{A_t \times f_u \times C_{RTU}}{r_{PO}} \qquad \text{EQ2}$$

      Where:

      C_{RTY} = reduction coefficient for mild-grade steel = 0.9
      C_{RTU} = reduction coefficient for high-grade steel = 0.8
      At = cross-sectional area of the test soil nail bar
      f_y = nominal yield resistance of test soil nail bar (mild steel)
      f_u = minimum ultimate tensile strength of test soil nail bar (high-strength steel)
      r_{PO} = nominal pullout resistance per unit length of soil nail = $\pi \times q_u \times D_{DH}$
      q_u = bond strength
      D_{DH} = drill hole diameter

   2. If LVBTmax > 10 ft, 10 ft ≤ LVBT ≤ LVBTmax

3. If LVBTmax < 10 ft, LVBT = 10 ft, increase the test soil nail bar size as needed, and recalculate LVBTmax until LVBTmax > 10 ft.

4. Calculate the maximum load during the verification test, defined as the Verification Test Load (VTL), as follows:

$$VTL = L_{BVT} \times r_{PO} \quad \text{EQ3}$$

f. Conduct verification tests by incrementally loading verification test nails to pullout or a maximum test load VTL in accordance with the loading schedule presented in Table 1.

g. Record soil nail movements at each load increment and at each time step. Zero dial gages after the alignment load (AL) has been applied.

h. Optionally, load verification test nails beyond VTL. After applying VTL, reduce loading to the AL and record the permanent set. Hold each load increment for at least 10 minutes.

i. Monitor the verification test nail for creep at a load of 0.75 VTL. Measure and record nail movements during the creep portion of the test in increments of 1 minute, 2, 3, 5, 6, 10, 20, 30, 50, and 60 minutes. Maintain the load during the creep test to within 2% of the intended load by using a load cell. Repump jack as needed to maintain load during hold times.

j. Optionally, perform stepped unloading. Consider between 1 to 7 intermediate steps in stepped unloading. If performed, hold each load step until gage readings are stable.

Table 1

Verification Test Loading Schedule		
Load	**Load**	**Hold Time (minutes)[2]**
AL	AL[1]	1
0.25DL	0.13 VTL	10 (record soil nail head movement at 1, 2, 5, 6, 10)
0.5DL	0.25 VTL	10 (record soil nail head movement at 1, 2, 5, 6, 10)
0.75DL	0.38 VTL	10 (record soil nail head movement at 1, 2, 5, 6, 10)
1.0DL	0.50 VTL	10 (record soil nail head movement at 1, 2, 5, 6, 10)
1.25DL	0.63 VTL	10 (record soil nail head movement at 1, 2, 5, 6, 10)
1.5DL	0.75 VTL (Creep Test)	10 (record soil nail head movement at 1, 2, 5, 6, 10, 30, 50, 60)

1.75DL	0.88 VTL	10
2.0DL	1.00 VTL	10
AL	AL	1[3]

[1]AL = 0.025 VTL or 0.05DL
[2]Measure soil nail head movement after each load increment has been achieved and at each indicated time step
[3]Record permanent soil nail movement

4. Proof Testing
   a. Demonstrate successful proof testing on at least 5% of production soil nails in each nail row or a minimum of one per row.
   b. Do not count verification tests towards the minimum of 5% of production nails.
   c. Perform proof tests on soil nails with a known bonded length and a measured temporary unbonded length.
   d. Select a bonded length (L_{BPT}) for the proof tests such that L_{BPT} is 10 ft or L_{BPTmax}, whichever is smaller.
   e. For Grade 75 or better, and other mild steel in accordance with ASTM A615, calculate the maximum length L_{BPTmax} as

$$L_{BPT\,\max} = \frac{A_t \times f_y \times C_{RTY}}{r_{PO} \times 0.75} \qquad \text{EQ4}$$

   f. For Grade 150 and other high strength steel in accordance with ASTM A722, calculate the maximum length L_{BPTmax} as

$$L_{BPT\,\max} = \frac{A_t \times f_u \times C_{RTU}}{r_{PO} \times 0.75} \qquad \text{EQ5}$$

   g. Allow for bond lengths less than 10 ft for production proof nails shorter than 12 ft.
   h. Do not proof test fully grouted nails
   i. Calculate the maximum load for proof tests, defined as the Proof Test Load (PTL), as follows:

$$PTL = L_{BPT} \times r_{PO} \times 0.75 \qquad \text{EQ6}$$

   j. Conduct proof tests by incrementally loading the proof test nail according to the test loading schedule in Table 2.
   k. Hold each load increment until stabilized and record soil nail movements at each load increment and time interval shown in Table 2.

l. Maintain all load increments to within 5% of the intended load. Repump jack as needed to maintain load during hold times.

m. Rezero dial gages after the alignment load is applied.

n. Perform creep tests at 1.00 PTL, beginning as soon as PTL is applied. Measure and record soil nail movement at 1 minute, 2, 3, 5, 6, and 10 minutes. If the nail movement measured between 1 minute and 10 minutes exceeds 0.04 inch, maintain the maximum test load for 50 additional minutes, and record soil nail movements at 20, 30, 50, and 60 minutes.

Table 2

Proof Test Loading Schedule		
Load	**Load**	**Hold Time (minutes)[3]**
AL[1]	AL[1]	1
0.25DL	0.17 PTL	Until movement stabilizes
0.5DL	0.33 PTL	Until movement stabilizes
0.75DL	0.50 PTL	Until movement stabilizes
1.0DL	0.67 PTL	Until movement stabilizes
1.25DL	0.83 PTL	Until movement stabilizes
1.5DL	1.0 PTL (Creep Test)[2]	10 (record soil nail head movement at 1, 2, 5, 6, 10)
AL	AL	1

[1]AL = alignment load ≤ 0.025 VTL or 0.05DL
[2]If soil nail movement measured between 1 and 10 minutes exceeds 0.04 inch, maintain PTL for 50 more minutes and record movements at 20, 30, 50, and 60 minutes. Record permanent soil movement.
[3]If the soils reinforced with nails are relatively susceptible to deformation or creep, hold each load increment for 10 minutes and record soil nail movement at 1, 2, 5, 6, and 10 minutes.

F. Soil Nail Test Acceptance Criteria

1. Verification test results: meet all of the following criteria:

a. The total creep movement is less than 0.08 inch between the 6- and 60- minute readings, and the creep rate is linear or decreasing throughout the creep test load hold period.

b. The total movement (ΔVTL) measured at VTL exceeds 80% of the theoretical elastic elongation of the unbonded length (L_{UB}) of the test nail, as depicted below in Equation 7.

$$\Delta VTL > 0.8\frac{VTL \times L_{UB}}{E \times A_t} \qquad \text{EQ7}$$

Where: E = Young's Modulus of steel (29,000 ksi)

c. Pullout does not occur before achieving 0.1 x VTL

2. Proof test results
   a. Creep movement between the 1- and 10-minute readings is less than 0.04 inch.
   b. If creep movement exceeds 0.04 inch between the 1- and 10-minute readings, the creep movement between the 6- and 60-minute readings must be less than 0.08 inch, and the creep rate must be linear or decreasing throughout the creep test load hold period.
   c. The total soil nail movement (ΔPTL) measured at PTL exceeds 80% theoretical elastic elongation of the unbonded length, as depicted below in Equation 8:

$$\Delta PTL > 0.8\frac{PTL \times L_{UB}}{E \times A_t} \qquad \text{EQ8}$$

   d. Pullout does not occur before the test load is 1.0 x PTL
   e. The temporary unbonded test length in proof tests is successfully maintained for subsequent satisfactory grouting. If the unbonded test length of production proof test nails cannot be satisfactorily grouted after testing, consider the proof nail to be sacrificial and replace with an additional production nail installed at no additional cost.

G. Soil Nail Test Rejection
   1. Verification Test Soil Nails
      a. Develop alternative design and/or installation methods recommended by the Soil Nail Designer, and install replacement verification test nails.
   2. Proof Test Soil Nails
      a. Provide the Soil Nail Designer's recommended resolution.
      b. The Engineer may require replacement of some or all installed production nails between a failed proof test nail and the adjacent passing proof test nail.
      c. Alternatively, the Engineer may require installation and testing of additional proof test nails to verify that adjacent previously installed production nails have sufficient nominal pullout resistance.

H. Wall Drainage
   1. Install and secure all elements of the soil nail wall drainage as shown on the drawings.

2. Wall drainage includes geocomposite drainage mat, PVC connection pipes, soil nail wall footing drains, and weep holes, as shown on the drawings.
3. Construct wall drainage to provide continuous and unrestricted flow to discharge water collected behind the wall face.
4. Excluding wall footing drains, construct all wall drainage elements prior to shotcreting.
5. Geocomposite drainage mats
    a. Center between columns of soil nails, as shown on the drawings.
    b. Minimum width = 12 inches
    c. Secure to the excavation face in a vertically continuous manner, with the geotextile side against the ground
    d. Prevent contamination of the geotextile with shotcrete.
6. Footing drains
    a. Install at the bottom of the wall, as shown on the drawings
    b. Envelop the footing drain aggregate and pipe with drainage geotextile such that they conform to the dimensions of the trench.
    c. Overlap the drainage geotextile on top of the drainage aggregate as shown on the drawings.
    d. Repair or replace damage drainage geotextile.

I. Shotcrete
1. Prepare shotcrete application surface according to the following:
    a. Prepare surface to line and grade.
    b. Clean loose material, mud, rebound, and other foreign matter.
    c. Remove curing compound on previously placed shotcrete surfaces by sandblasting.
    d. Install approved depth gages to indicate the thickness of shotcrete layers.
    e. Install depth gages on 6-ft centers longitudinally and transversely with at least 2 gages per increment of surface area to receive shotcrete.
    f. Moisten surfaces.
2. Place when ambient temperature is 40 degrees F or greater. Do not apply shotcrete during high winds or heavy rain. Protect and maintain shotcrete at a temperature above 40 degrees F until shotcrete has achieved a minimum strength of 750 psi.
3. Do not apply to frozen surfaces.
4. Use acceptable nozzle operators who have fabricated acceptable test panels for this project.
5. Apply dry-mix shotcrete within 45 minutes of batching. Apply wet-mix shotcrete within 90 minutes of batching.

6. Direct shotcrete at right angles to the receiving surface except when shooting ground reinforcing bars.
7. Apply in a steady and uninterrupted flow, in a circular fashion to build up the required layer thickness. If flow becomes intermittent, direct the flow away from the work area until it becomes steady.
8. Make the surface of each shotcrete layer uniform and free of sags, drips, or runs.
9. Limit the layer thickness of each shotcrete application to 2 inch. Thicker applications may be approved if the contractor can demonstrate that no sloughing or sagging is occurring. If additional thickness is required, broom or scarify the applied surface and allow the layer to harden. Dampen the surface before applying an additional layer.
10. Remove laitance, loose material, and rebound. Promptly remove rebound from the work area.
11. Taper construction joints to a thin edge over a distance of at least 1 ft. Wet the joint surface before placing additional shotcrete on the joint. Do not use square construction joints.
12. Install shotcrete final face finish using undisturbed gun finish as applied from the nozzle or a rod, broom, wood float, rubber float, steel trowel, or rough screeded finish as shown on the plans.
13. Where shotcrete is used to backfill bird's beaks position shotcrete nozzle into the mouth of the drillhole to completely fill the void.
14. Attachment of bearing plate and nut
    a. Attach a bearing plate, washers, and nut to each nail head as shown on the plans.
    b. Seat the bearing plate uniformly on the shotcrete while the facing is still plastic and before its initial set. Hand-wrench tighten the nut.
    c. Set the bearing plate in a bed of grout if needed to provide uniform contact between the plate and the shotcrete. Re-tighten the nut by hand with a wrench after the grout has set for 24 hours.
15. Refer to Table 3 for tolerances

Table 3

Construction Tolerances	
Item	**Tolerance**
Horizontal location of welded wire reinforcement, reinforcing bars, and headed studs	3/8 inch
Location of headed studs on bearing plate	¼ inch
Spacing between reinforcing bars	1 inch
Reinforcing lap	1 inch
Thickness of shotcrete if troweled or screeded	9/16 inch
Thickness of concrete if left as shot	1 1/8 inch
Planeness of finish surface, gap under 10-ft straight edge, if troweled or screeded	9/16 inch
Planeness of finish surface, gap under 10-ft straight edge, if left as shot	1 1/8 inch
Nail head bearing plate deviation from parallel to wall face	10 degrees

16. Do not place welded wire reinforcement directly against the soil. Place welded wire reinforcement in a manner to provide a minimum of 1 inch of shotcrete cover between the soil and the welded wire reinforcement.
17. Provide shotcrete test cores both from preconstruction test panels, construction test panels, and if needed from the constructed wall face. Conduct shotcreting and coring of test panels and the wall face using qualified personnel in the presence of the Engineer according to ACI 506.2. Refer to Section 02342S.
18. Deliver, store and handle materials in a manner that will prevent contamination, segregation, corrosion or damage.

END OF SECTION

August 3, 2016

SECTION 02924S

NOXIOUS WEED CONTROL

Add Section 02924:

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Controlling the introduction and spread of noxious weeds on construction projects.

1.2 RELATED SECTIONS Not Used

1.3 REFERENCES

A. Utah Noxious Weed Act, Utah Administrative Code (UAC) Rule R68-9

1.4 DEFINITIONS

A. Noxious weeds subject to control are those identified on Utah Noxious Weed Act and County Declared Noxious Weed List which are currently found growing within the project location.

B. Refer to the Section, article 3.3 for a list of the Utah State Noxious Weeds (Table 1) and the County Declared Noxious Weeds (Table 2).

1.5 SUBMITTALS Not Used

1.6 PAYMENT PROCEDURES

A. Include payment for cleaning earth-moving construction equipment under mobilization.

B. Pay for the control of noxious weeds using pre-emergent, selective, and non-selective herbicides by the unit area.

1.7 QUALITY ASSURANCE

A. Regulatory Requirements:
   1. Follow all regulatory, application, and safety precautions listed by the herbicide manufacturer.
   2. Apply herbicides using only state licensed pesticide applicators.

1.8 SEQUENCING

A. Clean all earth-moving equipment before bringing them on the project.

B. Treat existing noxious weeds 10 days before starting earthwork operations.

PART 2 PRODUCTS

2.1 HERBICIDE

A. Refer to this Section, article 3.3 for a list of noxious weeds subject to control and the recommended herbicide for each species.

B. Use commercially available herbicides specified to control the noxious weed species identified.

PART 3 EXECUTION

3.1 PREPARATION

A. Use high-pressure water blasting or steam cleaning methods to clean all earth-moving construction equipment (scrapers, bulldozers, excavators, backhoes, trenchers) of dirt, mud, and seed residue before initially entering the project.

3.2 EXAMINATION

A. Verify and locate all noxious weeds on the project. Coordinate with Engineer if assistance is needed for identification.

3.3 CONTROLLING NOXIOUS WEEDS

A. Spray noxious weeds located within the project limits before starting earth disturbing activities and if they appear during construction. Use appropriate herbicides and recommended rates to control spread of noxious weeds (See Noxious Weed Tables 1 and 2 below). Apply herbicide as directed on the manufacturer's label.

B. State of Utah and County Declared Noxious Weed Tables:

Table 1 – State of Utah Noxious Weed List

Class 1A: Early Detection Rapid Response (EDRR) – Watch List Declared noxious and invasive weeds not native to the state of Utah and not known to exist in the State that pose a serious threat to the state and should be considered as a very high priority.		
Common Name	***Scientific Name***	**Herbicide** (Active Ingredient)
Common crupina	*Crupina vulgaris*	aminocyclopyrachlor + chlorsulfuron
African rue	*Peganum harmala*	glyphosate, imazapyr or metsulfuron
Small bugloss	*Anchusa arvensis*	2,4-D + dicamba
Mediterranean sage	*Salvia aethiopis*	2,4-D, clopyralid or picloram
Spring millet	*Milium vernale*	2,4-D
Syrian beancaper	*Zygophyllum fabago*	glyphosate, imazapic, picloram or metsulfuron
Ventenata (North Africa grass)	*Ventenata dubia*	imazapic or sulfosulfuron
Plumeless thistle	*Carduus acanthoides*	Clopyralid or 2,4-D
Malta starthistle	*Centaurea melitensis*	Aminopyralid, 2,4-D, clopyralid or dicamba
Class 1B: Early Detection Rapid Response (EDRR) Declared noxious and invasive weeds not native to the State of Utah that are known to exist in the state in very limited populations and pose a serious threat to the state and should be considered as a very high priority.		
Common Name	***Scientific Name***	**Herbicide** (Active Ingredient)
Camelthorn	*Alhagi maurorum*	2,4-D or dicamba
Garlic mustard	*Alliaria petiolata*	glyphosate
Purple starthistle	*Centaurea calcitrapa*	picloram or clopyralid
Goatsrue	*Galega officinalis*	2,4-D, dicamba or metsulfuron
African mustard	*Brassica tournefortii*	glyphosate, 2,4-D, or triclopyr
Giant reed	*Arundo donax*	glyphosate, triclopyr, or imazapyr
Japanese knotweed	*Polygonum cuspidatum*	dicamba

Blueweed (Vipers bugloss)	*Echium vulgare*	2,4-D amine
Elongated mustard	*Brassica elongata*	metsulfuron or chlorsulfuron
Common St. Johnswort	*Hypericum perforatum*	2,4-D or metsulfuron
Ox-eye daisy	*Chrysanthemum leucanthemum*	dicamba, picloram or clopyralid
Cutleaf vipergrass	*Scorzonera laciniata*	2,4-D

Class 2: Control

Declared noxious and invasive weeds not native to the state of Utah, that pose a threat to the state and should be considered a high priority for control. Weeds listed in the control list are known to exist in varying populations throughout the state. The concentration of these weeds is at a level where control or eradication may be possible.

Common Name	***Scientific Name***	**Herbicide** (Active Ingredient)
Leafy spurge	*Euphorbia esula*	dicamba or picloram
Medusahead	*Taeniatherum caput-medusae*	glyphosate
Rush skeletonweed	*Chondrilla juncea*	picloram, clopyraid or 2,4-D
Spotted knapweed	*Centaurea maculosa*	2,4-D + dicamba, picloram or clopyralid
Purple loosestrife	*Lythrum salicaria*	glyphosate (aquatic label)
Squarrose knapweed	*Centaurea virgata*	2,-4D, dicamba or picloram
Dyer's woad	*Isatis tinctoria*	2,4-D + dicamba or chlorsulfuron
Yellow starthistle	*Centaurea solstitialis*	picloram or clopyralid
Yellow toadflax	*Linaria vulgaris*	picloram
Diffuse knapweed	*Centaurea diffusa*	2,4-D + dicamba, picloram or clopyralid
Black Henbane	*Hyoscyamus niger*	picloram + metsulfuron
Dalmation toadflax	*Linaria dalmatica*	imazapic or picloram

Class 3: Containment

Declared noxious and invasive weeds not native to the State of Utah that are widely spread. Weeds listed in the containment noxious weeds list are known to exist in various populations throughout the state. Weed control efforts may be directed at reducing or eliminating new or expanding weed populations. Known and established weed populations, as determined by the weed control authority, may be managed by any approved weed control methodology, as determined by the weed control authority. These weeds pose a threat to the agricultural industry and agricultural products.

Common Name	***Scientific Name***	**Herbicide** (Active Ingredient)

Russian knapweed	*Centaurea repens*	picloram, clopyralid or chlorsulfuron
Houndstounge	*Cynoglossum officinale*	picloram
Perennial pepperweed (Tall whitetop)	*Lepidium latifolium*	metsulfuron or chlorsulfuron
Phragmites (Common reed)	*Phragmites australis ssp.*	glyphosate (aquatic label)
Tamarisk (Saltcedar)	*Tamarix ramosissima*	aminopyralid + triclopyr
Hoary cress (Whitetop)	*Cardaria draba*	2,4-D + dicamba or shlorsulfuron
Canada thistle	*Cirsium arvense*	2,4-D, dicamba, picloram
Poison hemlock	*Conium maculatum*	picloram
Musk thistle	*Carduus nutans*	2,4-D amine, metsulfuron, picloram
Quackgrass	*Elytrigia repens*	glyphosate
Jointed goatgrass	*Aegilops cylindrica*	glyphosate, impazapic
Bermudagrass *	*Cynodon dactylon*	glyphosate
Perennial Sorghum spp. (Johnsongrass)	*Sorghum halepense* and *Sorghum almum*	glyphosate
Scotch thistle (Cotton thistle)	*Onopordum acanthium*	2,4-D amine, metsulfuron, or picloram
Field bindweed (Wild Morning-glory)	*Convolvulus ssp.*	2,4-D + dicamba or picloram
Puncturevine (Goathead)	*Tribulus terrestris*	2,4-D anime

* Bermudagrass (*Cynodon dactylon*) shall not be a noxious weed in Washington County and shall not be subject to provisions of the Utah Noxious Weed Law within the boundaries of that county. It shall be a noxious weed throughout all other areas of the State of Utah and shall be subject to the laws therein.

Class 4: Prohibited

Declared noxious and invasive weeds, not native to the State of Utah, that pose a threat to the state through the retail sale or propagation in the nursery and greenhouse industry. Prohibited noxious weeds are annual, biennial, or perennial plants that the commissioner designates as having the potential or are known to be detrimental to human or animal health, the environment, public roads, crops, or other property.

Common Name	***Scientific Name***	**Herbicide** (Active Ingredient)
Cogongrass (Japanese blood grass)	*Imperata cylindrica*	glyphosate or imazapyr
Myrtle spurge	*Euphorbia myrsinites*	glyphosate or dicamba
Dames Rocket	*Hesperis matronalis*	glyphosate or triclopyr

Scotch broom	*Cytisus scoparius*	glyphosate or triclopyr
Russian olive	*Elaeagnus angustifolia*	aminopyralid + triclopyr

Table 2 – County Declared Noxious Weeds

Common Name	***Scientific Name***	**Herbicide** (Active Ingredient)
Beaver County		
Bull thistle	*Cirsium vulgare*	2,4-D amine or dicamba
Davis County		
Buffalobur	*Solanum rostratum*	2,4-D or dicamba
Duchesne County		
Western Water hemlock	*Cicuta douglasii*	2,4-D amine or dicamba
Garfield County		
Rubber Rabbitbrush	*Ericameria nauseosa*	2,4-D, dicamba, clopyralid or metsulfuron
Iron County		
Bull thistle	*Cirsium vulgare*	2,4-D amine or dicamba
Whorled milkweed	*Asclepias subverticillata*	2,4-D + dicamba or picloram
Juab County		
Blue flowering lettuce	*Lactuca tatarica*	2,4-D amine, impazapyr or metsulfuron
Morgan County		
Burdock	*Arctium minus*	2,4-D + dicamba
San Juan County		
Buffalobur	*Solanum rostratum*	2,4-D or dicamba
Whorled milkweed	*Asclepias subverticillata*	2,4-D + dicamba or picloram
Summit County		
Burdock	*Arctium minus*	2,4-D + dicamba
Uintah County		
Common teasel	*Dipsacus fullonum*	2,4-D amine
Washington County		
Halogeton	*Halogeton glomeratus*	2,4-D
Silverleaf nightshade	*Solanum elaegnifolium*	glyphosate or imazapyr
Whorled milkweed	*Asclepias subverticillata*	2,4-D + dicamba or

		picloram
Wayne County		
Bull thistle	*Cirsium vulgare*	2,4-D amine or dicamba

SECTION 03152M

CONCRETE JOINT CONTROL

Add the* following*:

PART 3 EXECUTION

3.1 RE-SEALING JOINTS WITH HOT-APPLIED JOINT SEALANT

A. Clean joints using compressed air at a minimum of 100 psi.

B. Apply hot-poured joint sealant to the joint prior to opening to traffic.

C. <u>Do not overfill joints.</u>

D. Allow hot-poured joint sealant to cure prior to opening to traffic to prevent tracking of the sealant.

E. Apply sealant with a fine tip nozzle capable of placing the material in the joint.

F. Plowable pavement marker sealant removed by grinding operation
1. Seal the cavities left from the removed plowable pavement markers the same as above.

SECTION 03310M

STRUCTURAL CONCRETE

Delete Article 2.1, paragraph A and replace with the following:

A. Class AA(AE) concrete, maximum shrinkage 0.03 percent at 28 days - refer to AASHTO T 160. Maximum water to cementitious ratio (w/c) 0.40. All other properties refer to Section 03055.

END OF SECTION

July 12, 2016

SECTION 03312S

STRUCTURAL CONCRETE FOR DECKS AND APPROACH SLABS

Add Section 03312:

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Materials and procedures for producing low shrinkage Portland Cement Concrete for bridge decks and approach slabs.

B. Materials and procedures for constructing structural concrete for bridge decks and approach slabs.

1.2 RELATED SECTIONS

A. Section 03055: Portland Cement Concrete

B. Section 03152: Concrete Joint Control

C. Section 03211: Reinforcing Steel and Welded Wire

D. Section 03310: Structural Concrete

E. Section 05832: Expansion Joints

1.3 REFERENCES

A. AASHTO M 6: Fine Aggregate for Portland Cement Concrete

B. AASHTO M 80: Coarse Aggregate for Portland Cement Concrete

C. AASHTO M 85: Portland Cement

D. AASHTO M 111: Zinc (Hot-dip Galvanized) Coatings on Iron and Steel Products

E. AASHTO M 154: Air-Entraining Admixtures for Concrete

R. ASTM C 595: Blended Hydraulic Cements

S. ASTM C 1157: Hydraulic Cement

T. ASTM C 1579 - Standard Test Method for Evaluating Plastic Shrinkage Cracking of Restrained Fiber Reinforced Concrete (Using a Steel Form Insert)

U. ASTM C 1567: Determining the Potential Alkali-Silica Reactivity of Combinations of Cementitious Materials and Aggregate (Accelerated Mortar-Bar Method)

V. ASTM C 1602: Mixing Water Used in the Production of Hydraulic Cement Concrete

W. UDOT Minimum Sampling and Testing Requirements Manual

X. UDOT Quality Management Plan

Y. UDOT Quality Control/Quality Assurance (QC/QA) Procedures

1.4 DEFINITIONS

A. Microsynthetic Fiber – Synthetic fibers with diameters or equivalent diameters less than 0.012 inch.

B. Macrosynthetic Fiber – Synthetic fibers with diameters or equivalent diameters greater than 0.012 inch.

C. Monofilament- Single filament fiber, typically cylindrical in cross-section.

1.5 SUBMITTALS

A. Mix design for Class AA(AE) concrete for approval.
   1. Provide, as a key component to the mix design, a well graded combined aggregate structure.
   2. Submit a combined gradation for the mix design. Provide targets for each required sieve ($^{3}/_{4}$", $^{1}/_{2}$", $^{3}/_{8}$", #4, #8, #16, #30, #50, #100, #200), for the purpose of production control and acceptance.
   3. Perform the trial batch using full production operations.
      a. Use the same components in the trial batches that will be used in the project. Accelerators and site-added air-entrainment can be incorporated in the trial batch but are not required. The Contractor assumes responsibility for the compatibility of all admixtures with the mix design and their potential effects on concrete properties.
      b. Personnel performing and witnessing trial batches and performing compressive and flexural strength testing must be Department TTQP Concrete and Concrete Strength Testing qualified.
      c. The Department or its representative is to witness the trial batch.
      d. Compressive and flexural strength testing for verification of trial batches will be performed by an AASHTO accredited laboratory, approved through the Department Laboratory Qualification Program.

C. Test results establishing a density (unit weight) target of freshly mixed concrete according to AASHTO T 121.

D. Test results verifying the coarse and fine aggregate used according to this Section, article 2.1, paragraph D.

E. Test results for any proposed mix design for potential reactivity of coarse and fine aggregates according to the requirements of the UDOT Quality Management Plan for Ready-Mix Concrete.

F. Test results to determine the ability of the combinations of cementitious materials and aggregates to control the reactivity when using potentially reactive aggregates in a mix design.

G. Shrinkage test results according to ASTM C 157.

H. Verification that cement used is from a pre-qualified supplier. Refer to this Section, article 2.1, paragraph B.5.

I. Written plan for admixtures. Refer to this Section, article 2.1, paragraph

J. Verification that fly ash or other pozzolan used is from a pre-qualified supplier. Refer to this Section, article 2.1, paragraph G.

K. Verification that the batch plant meets the requirements of the UDOT Quality Management Plan for Ready-Mix Concrete.

L. Cold and hot weather plans.

M. Surface evaporation plan according to Section 03310.

N. Concrete Placement and Finishing Plan for approval at least 10 days before the Pre-Activity Meeting.
   1. Include the following:
      a. Description of equipment, materials, and personnel for placing, finishing, and curing concrete
      b. Methods for placing, finishing, and curing concrete.
      c. Placement schedule, including placement rates, time of day, duration, deck section being placed, etc.
      d. Quality control plan.

1.6 ACCEPTANCE

A. Acceptance is according to UDOT Minimum Sampling and Testing Requirements Section 03055 with the following exceptions:
   1. Frequency requirements for Slump are suspended
   2. Test fresh concrete density (unit weight) according to AASHTO T121 at the same frequency as Air Content and Concrete Temperature.
      a. Batch fails if the unit weight of the fresh concrete in the field varies more than ± 5 lb/ft^3 from the target density for fresh concrete established by the mix design
   3. Reject batch if water/cementitious ratio exceeds the water/cementitious ratio established in the trial batch.

B. Pre-approve stockpiles before production. Provide quality control sieve analysis during production**.**

1. For acceptance, allow a variance of the sieve targets established by the mix design and submitted to the Department (this Section, article 1.5, paragraph A) as determined in Table 1.

Table 1

Sieve Size	**Percent Passing Allowable Tolerance**
$^3/_4$", $^1/_2$", $^3/_8$"	± 10%
#4, #8	± 5 %
#16, #30, #50	± 4%
#100 and #200	± 3%

C. The Department may accept the item at a reduced price when concrete is below specified strength and does not have a separate strength pay factor.

1. The pay factor will be applied to the quantity of the bid item that is represented by the strength tests that fall below a specified strength.
2. The Department will calculate the pay factor using Table 2 based on 28 day compressive strength.

Table 2

Price Reduction for 28 Day Compressive Strength	
Psi below Specified Strength	**Pay Factor**
1-200	0.98
201-400	0.95
More than 400	Reject

3. The Engineer may accept a “reject” lot based on an engineering analysis and concurrence from the Region Materials Engineer. Apply a pay factor of 0.50 if a reject lot is allowed to remain in- place.

PART 2 PRODUCTS

2.1 CONCRETE

A. Concrete Class and Mix Requirements

1. Refer to the requirements in Table 3.

Table 3

Class	Coarse Aggregate or Sieve Size	Max. Water/ Cementitious Ratio	Air Content Percent (%)*	Mix Design Compressive Strength *f* 'cr (psi)	28 Day Minimum Compressive Strength *f* 'c (psi) **
AA(AE)	1" to No. 4	0.40	5.0 - 7.5	5,200	4,000
	¾" to No. 4	0.40	5.0 - 7.5	5,200	4,000

* Values listed represent in-place air content. Make necessary adjustments for impacts to air content due to placement.

2. Maximum nominal size of coarse aggregate:
   a. Not larger than $^1/_5$ the narrowest dimension between sides of forms.
   b. Not larger than ⅓ the depth of slabs.
   c. Not larger than ¾ the minimum clear distance between reinforcing bars or between bars and forms, whichever is less.

3. Do not exceed water/cementitious ratio.
   a. Calculate the water/cementitious ratio (w/c) according to the following formula:

$$\frac{W}{C} = \frac{Water}{Cement + Pozzolan}$$

4. Do not exceed 30 percent total pozzolan in any mix unless approved or otherwise specified.

5. Do not exceed a shrinkage limit of 0.03 percent at 28 days when tested according to ASTM C 157.

B. Cement
   1. Use Type II Portland cement or blended hydraulic cement unless otherwise specified. Refer to ASTM C 150, ASTM C 595, ASTM C 1157.

   2. Portland Cement
      a. Refer to Tables 1 and 3 in ASTM C 150.
      b. Refer to Table 2 in ASTM C150 for low-alkali cement.

   3. Blended Hydraulic Cement
      a. Blended hydraulic cement substituted for portland cement:
         1) Use ASTM C 1567 to verify that expansion is less than 0.1 percent 14 days after the zero reading.
         2) Refer to the equivalent cements listed in Table 4.

b. Do not exceed 30 percent total pozzolan limit when adding flyash to a blended hydraulic cement.
   1) Submit documentation of the total pozzolan content with the mix design.

Table 4

Portland Cement/Blended Hydraulic Cement Equivalencies		
AASHTO M 85 (Low Alkali)	**ASTM C 595**	**ASTM C 1157**
*Type I	IP	GU
Type II	IP (MS)	MS
*Type III	-	HE
*Type V	-	HS

* Use only when specified

4. Do not use cement that contains lumps or is partially set.
5. Use cement from the list of Department qualified suppliers list maintained by the Department Materials Quality Assurance Section.
6. Do not mix cements originating from different sources.
7. Do not use air-entrained cement.
8. Department will sample and test the cement according to UDOT Quality Management Plan 502: Cement.

C. Synthetic Fiber Reinforcement
1. Provide products from one manufacturer.
2. Microsynthetic fiber, use monofilament synthetic fibers at 2 lb. per cu. yd. of concrete mix.
3. Macrosynthetic fiber, a minimum flexural strength ratio ($R_{e,3}$) of 25 percent when tested in accordance with ASTM C 1609/C 1609M is required. Use 4 lb. per cu. yd. of concrete mix.
4. Store the fibers in a dry, covered area, free of contamination.
5. Evaluate trial batches to ensure workability of the concrete.
6. Conform to ASTM C 1116/C 1116M, Type III and the requirements of ICC-ES AC32 Section 3.1.1 (plastic shrinkage reinforcement) and Section 3.1.2 (shrinkage and temperature reinforcement).
7. Do not introduce fibers at the same time as the cement is being introduced. Mix for at least five minutes after the addition of the fibers.

D. Aggregate
1. Coarse Aggregate for Normal Concrete Mixes
   a. Use coarse aggregate that meets AASHTO M 80 physical properties.
   b. Do not exceed percentages of deleterious substances as specified in AASHTO M 80, Table 2, for Class A aggregates.

2. Fine Aggregate for Normal Concrete Mixes
    a. Use fine aggregate that meets AASHTO M 6 physical properties.
    b. Do not exceed percentages of deleterious substances as specified in AASHTO M 6, Table 2, for class A aggregates, using option “b” for material finer than the No. 200 sieve.
3. Provide a well graded combined gradation.

E. Water
1. Use potable water or water that meets ASTM C 1602, including Table 2.

F. Admixtures
1. Do not use calcium chloride.
2. Air Entrainment according to AASHTO M 154, including Section 5.
3. Water Reducing Agents
    a. Refer to AASHTO M 194.
    b. High Range Water Reducer (HRWR) – Submit a written plan for approval with the trial batch that shows proper attention will be given to ingredients, production methods, handling, and placing.
4. Accelerators – Refer to AASHTO M 194.
5. Set Retarding Admixtures – Refer to AASHTO M 194.
    a. Establish the effective life of the set-retarding admixture by trial batch if set retarding admixtures are required due to haul times exceeding the time limitations in Section 03055.
    b. Do not exceed any manufacturer recommendations for the use of the set retarding admixture.
    c. Do not re-dose the concrete with additional set retarding admixture.
    d. Add set retarding admixture at the batch plant at the time of initial batching operations.
    e. Show on batch tickets the amount of admixture used.
    f. Time of placement is established by the trial batch and supersedes the requirements in Section 03055 .
6. Site-added air-entrainment – Refer to AASHTO M 154.
    a. Limit the use of site-added air-entraining agents to one addition per load, regardless of quantity.
    b. Use pre-measured admixtures.
    c. Record amount used on batch ticket.
    d. Rotate the drum at least 30 revolutions at the mixing speed recommended by the supplier.
    e. Retest fresh concrete density (unit weight). Refer to this

Section,
article 1.6, paragraph

G. Pozzolan
   1. Fly Ash
      a. Class F according to AASHTO M 295 except Table 2.
      b. Fly ash may be sampled and tested for compliance at any time.
         1) Loss on Ignition (LOI) - Not to exceed 3 percent.
         2) Allowable CaO content - Not to exceed 15 percent.
         3) Use fly ash from the list of Department pre-qualified sources maintained by Department Central Materials.
         4) Label the storage silo for fly ash to distinguish it from cement.
         5) Use different size unloading hoses and fittings for cement and fly ash.
   2. Use pozzolan from the list of Department qualified suppliers list maintained by the Department Central Materials.
   3. Department will sample and test the pozzolan according to the UDOT Quality Management Plan 507: Flyash and Pozzolan.

2.2 REINFORCING STEEL AND WELDED WIRE

A. Refer to Section 03211.

2.3 JOINTS AND SEALERS

A. Premolded and Preformed Joint Filler – Refer to Section 03152.

2.4 BACKER ROD

A. Use backer rod composed of closed-cell polyethylene foam of sufficient size to prevent the sealant from passing to the bottom of the groove. Refer to Section 03152.

2.5 WATERSTOPS

A. Refer to Section 03152.

2.6 RIGID PLASTIC FOAM

A. Preformed, extruded, cellular polystyrene thermal insulation material that has a water absorption property of 0.3 or less. Refer to ASTM C 578.

2.7 CURING COMPOUND

A. Refer to ASTM C 309, Type I D, Class A.

2.8 FORMS

A. Plywood, wood, metal, glass, or a combination of these materials.

2.9 MISCELLANEOUS STEEL ITEMS

A. Galvanize all miscellaneous steel items permanently cast into structural concrete elements. Refer to AASHTO M 111.

2.10 EPOXY ADHESIVE

A. Refer to AASHTO M 235, Type II.

PART 3 EXECUTION

3.1 PREPARATION

A. Pre-Activity Meeting
   1. Contractor, Department, and Supplier personnel involved with completing the work must attend the Pre-Activity Meeting.
   2. Conduct Pre-Activity meeting within 48 hours prior to concrete placement.
   3. Provide notification of the meeting to the Engineer 10 days in advance.
   4. Discuss items specific to bridge deck and approach slab concrete work including the following:
      a. Methods for placing, finishing, and curing.
      b. Schedule, production rates, construction practices, and quality control procedures.
      c. Required submittals.
      d. Sampling and testing.
      e. Verification of placement and clearances of reinforcing steel.

B. Aggregate Stockpiles
   1. Construct stockpile platforms so that subgrades are prevented from intruding into aggregates.
   2. Build stockpiles at least two days before use.
   3. Provide an operator and front-end loader to help the Engineer take aggregate samples.
   4. Aggregate may not be accepted more than 30 days before use.
   5. Construct stockpiles to minimize segregation of aggregates.

6. Allow washed aggregates to drain to uniform moisture content before use (12 hr minimum).

C. Falsework
   1. Refer to Section 03310.

D. Forms
   1. Refer to Section 03310.

3.2 BATCH MATERIALS

A. Refer to AASHTO M 157.

3.3 MIX DESIGN

A. Design the cementitious system to mitigate potential alkali-aggregate reactivity.
   1. Use a minimum of 20 percent flyash by weight of the total cementitious system.

B. Use only concrete mixes that have been approved by the Department

3.3 DECK SLABS

A. Do not place parapet forms or parapet for at least seven days and until it has attained required design strength or leave all falsework in place and design it to carry all additional loads that are part of the parapet placement process.

3.5 PLACE CONCRETE

A. Place concrete according to the approved Concrete Placement and Finishing Plan.

B. Refer to Section 03310

3.6 PUMP CONCRETE

A. Refer to Section 03310

3.7 LIMITATIONS

A. Refer to Section 03310.

3.8 CYLINDER STORAGE DEVICE

A. Refer to Section 03055.

3.9 EXPANSION JOINTS

A. Expansion joints – Refer to Section 05832

B. Adjust joint widths as shown on the plans.

3.10 CONSTRUCTION JOINTS

A. Refer to Section 03310.

3.11 CONCRETE SURFACE FINISHING CLASSIFICATIONS

A. Refer to Section 03310.

3.12 CONCRETE SURFACE FINISHING

A. Refer to Section 03310.

3.13 CONCRETE SURFACE FINISHING PROCEDURES

A. Finish concrete according to the approved Concrete Placement and Finishing Plan

B. Refer to Section 03310

3.14 CURE BRIDGE DECKS AND APPROACH SLABS

A. Cure all newly placed concrete to prevent loss of water for at least 14 continuous days as follows:
   1. Formed surfaces
      a. Cure formed surfaces of concrete by retaining the forms in place without loosening for the required curing time period.
      b. Seal formed surfaces by applying a liquid membrane curing compound immediately after forms are removed and necessary finishing has been done when forms are removed during the required curing time period.
         1) Apply membrane-curing compound uniformly at the manufacturer's recommended rate, but not less than 100 ft2/gal.
         2) Immediately repair any areas damaged during the specified curing period by re-spraying.
         3) Do not use on surfaces where rubbed finish is required or on surfaces of construction joints unless it

is removed by sand blasting before placing concrete against the joint.

2. Exposed surfaces
   a. Cure the top surfaces of bridge decks and approach slabs by a combination of the liquid membrane-curing compound method and the water method.
   b. Apply membrane-curing compound so that no portion of the deck or approach slab is exposed to the atmosphere for more than 20 minutes after the tining or finishing operation.
      1) Apply membrane-curing compound uniformly at the manufacturer's recommended rate but not less than 100 ft2/gal.
      2) Use a work bridge that follows immediately after the finishing machine to allow application of the curing compound while the concrete is still plastic.
   c. Completely cover all newly placed concrete areas in bridge decks and approach slabs with material that retains moisture and does not prevent evaporation, such as cotton or burlap mats as soon as the concrete is sufficiently set to support the materials.
      1) Secure the cotton or burlap mats to prevent wind or other forces from removing them.
      2) Do not damage the finish.
   d. Keep the entire area of newly placed concrete damp continuously for 14 days after placement.
      1) Do not erode or damage the surface.
      2) Prevent excess water from impacting traffic on in- service roadways.
3. Fogging
   a. Fogging may be used to increase the relative humidity above the fresh concrete and minimize the loss of moisture through evaporation when necessary.
   b. To curb effects of low humidity, wind or high temperatures before the application of curing materials, concrete being placed and finished for bridge decks and approach slabs may be protected from damage due to rapid evaporation by fogging.
   c. Incorporate the use of compressed air misters that atomize the water, producing a very fine mist and not a spray when fogging equipment is used.
      1) Use equipment that allows for adjusting the rate of fogging depending on the conditions that are present.
      2) Do not aim misters in a direction lower than horizontal at 5 ft above the concrete surface.

3) Do not use fogging to apply excess water to the concrete surface to aid finishing.
4) Discontinue fogging when a fine coating of water or sheen is visible on the concrete surface.

d. Do not affect the water/cement ratio of the concrete.

B. Follow the cold and hot weather limitations for curing according to Section 03310.

3.15 FORM REMOVAL

A. Refer to Section 03310.

3.16 CLEAN

A. Refer to Section 03310.

END OF SECTION

3—EXCEPTIONS

Exceptions to UDOT Standard Specifications and Supplemental Specifications

These Contract provisions revise the Utah Department of Transportation's *2012 Standard Specifications for Road and Bridge Construction* as modified by the 2012 Supplemental Specifications, and contain requirements generally applicable to the Work to be performed by Design-Builder. In certain cases, provisions in the Standard Specifications have been superseded by other provisions of the Contract Documents.

Any conflicts, ambiguities, or lack of clarity in regards to items included in this Exceptions, will be interpreted and defined by the Department in its sole discretion. The Design-Builder shall not take advantage of any apparent conflict, omission, ambiguity, inconsistency, inaccuracy, deficiency, or inadequacy related to the definition of roles and responsibilities in the execution of the Work. Should it appear that any definition of roles and responsibilities is contrary to the philosophy of such established by this exception, it is the responsibility of the Design-Builder to request a determination by the Department related to the respective roles and responsibilities of the Design-Builder and the Department.

The Standard Specifications are incorporated herein except as otherwise provided in the Contract Documents, and with the following general exceptions:

General Exceptions

1. When these Standard Specifications refer to "Engineer", such reference shall mean the definition given in Part 1, Appendix A (Acronyms and Definitions List), except when specified otherwise within these General Exceptions.
2. When these Standard Specifications refer to "Contractor", such reference shall mean the Design-Builder, except when specified otherwise within these General Exceptions.
3. Decisions regarding price adjustments outlined in these Standard Specifications shall be the responsibility of the Engineer as defined in Part 1, Appendix A (Acronyms and Definitions List), with such decisions coordinated with the Department.
4. Decisions regarding reject materials, especially in regards to allowing nonconforming Work to remain in place at a reduced payment, will always be the Department's.
5. When these Standards Specifications refer to the project, projects, or UDOT project, such references shall mean the Project.
6. All references to measurement and payment shall be disregarded except as provided in General Exception 7 below.
7. When these Standard Specifications refer to any payments or adjustments above the Contract Amount, or similar phrases, such references will be disregarded. It is the intent that the payment of the Contract Amount will be full compensation for all Work performed pursuant to the Design-Build Contract unless provided for in Part 2 (General Provisions). An exception is that a Change

Order pursuant to Part 2 (General Provisions) may be issued by the Department for incentives provided for in the Standard Specifications.

8. When these Standard Specifications describe actions, materials, means, or methods that are required and that are qualified by phrases of direction, designation, or permission of the Engineer (e.g., "directed by the Engineer", "direction of the Engineer", "Engineer may direct", "discretion of the Engineer", "designated by the Engineer", "Engineer designated", or "permission from the Engineer"), such phrases shall be disregarded. If it is not clear whether a phrase should be disregarded, the Department will make that decision in its sole discretion. When these Standard Specifications refer to persons, offices, or divisions within the Department, such reference shall mean Department.

9. When an approval or authorization of the Engineer is required in these Standard Specifications for the use of alternative or substituted processes, material, or components, the Engineer shall mean Department.

10. When these Standard Specifications refer to an approval of any correction or repair that deviates from the Contract requirements, follow the requirements of Part 2 (General Provisions).

11. When these Standard Specifications provide that reports, records, or other documents shall be submitted or furnished to the Department, such reports shall be made available upon request to the Department and do not have to be submitted, provided no other requirement exists for submittal.

12. When these Standard Specifications require approval of shop drawings, falsework drawings, or erection plans, such approval shall be from the Engineer as defined in Part 1, Appendix A (Acronyms and Definitions List).

13. When these Standard Specifications require actions, materials, means, or methods that are not designated in the Released for Construction Documents, such phrases shall be disregarded.

14. When these Standard Specifications refer to the "Engineer" ordering work beyond the scope of work in the Contract, such phrases shall be disregarded, and the Design-Builder shall refer to Part 2 (General Provisions).

15. Wherever references to "Engineer" result in testing or acceptance procedures being assigned to the Engineer, acceptance shall be on behalf of the Department.

16. Any references in these Standard Specifications to the Engineer that refer to the time period after Final Acceptance shall mean the Department.

17. When these Standard Specifications require notifications to the Engineer, Engineer shall mean the Department and Engineer.

18. When these Standard Specifications refer to approval of the ability to work during times and dates other than those specified, the Approval shall be the Department's.

19. Wherever these Standard Specifications refer to an approved product or laboratory, such references shall mean Department Approved product or laboratory

20. Wherever these Standard Specifications refer to a pre-qualified supplier, such references shall mean Department pre-qualified suppliers; pre-qualified according to the UDOT Quality Management Plans.

21. Unless otherwise specified, when these Standard Specifications refer to Department performing tests, such references shall mean the Design-Builder.

22. For any references to Liquidated Damages, refer to Part 2 (General Provisions). This does not apply to incentive/disincentive provision.

23. For references to Substantial Completion, construction completion, project completion, and Contract Completion, refer to Part 2 (General Provisions).

24. Warranties shall be covered under the Warranty Provisions of Part 9 (Warranty Provisions).

GENERAL

The Design-Builder shall perform all of the Department's obligations in each Third-Party Agreement, except for payment to Third Parties for Third-Party-performed work. The Department retains its rights and responsibilities pertaining to cost share reimbursement, audit, oversight, and any other elements of the Third-Party Agreements at the Department's sole discretion.

A T & T CORP.
MASTER UTILITY AGREEMENT

THIS MASTER UTILITY AGREEMENT, made and entered into this _____ day of_____, 20_____, by and between the **Utah Department of Transportation**, ("UDOT") and **AT&T Corp.**, doing business as AT & T Corp., a Registered Corporation in the State of New York licensed to operate in the State of Utah , ("Company") (each as "Party" and jointly as "Parties").

RECITALS

WHEREAS, UDOT is preparing to request proposals for and award a design-build contract for the highway project identified as Project Number S-0154(12)11, 4 Interchanges on Bangerter Highway in Salt Lake County, Utah, ("Project"); and

WHEREAS, UDOT's design-build contractor ("Design-Builder") will complete the design and administer construction of the Project; and

WHEREAS, UDOT has identified Company facilities within the limits of the Project which may necessitate the relocation, protection, or adjustment of the facilities, ("Utility Work"); and

WHEREAS, the Company desires for the Design-Builder to design and construct the Company's Utility Work necessitated by the Project with the exception of cable/hand hold procurement, pulling, and splicing; and

WHEREAS, the Company will perform the necessary design review, inspection, cable/hand hold procurement, pulling, and splicing to accommodate the Project; and

WHEREAS, for the purpose of expediting any required Utility Work and reimbursement the Parties are entering into this Project Master Utility Agreement with the understanding that future supplemental agreements to this Agreement will be entered into covering Utility Work to be accomplished by the Company and UDOT at specific Project locations.

THIS AGREEMENT is made to set out the terms and conditions where under the Utility Work shall be performed.

DRAFT

AGREEMENT

NOW THEREFORE, the Parties agree as follows:

1. CONTACT INFORMATION

UDOT's Project Representative is Alana Spendlove, UDOT Project Utility and Railroad Leader, telephone number (801) 887-3462, and e-mail aspendlove@utah.gov.

UDOT's Resident Engineer for 5400 South and 7000 South interchanges is Bryan Chamberlain, telephone number (801) 887-3405, and e-mail bchamberlain@utah.gov, or their designated representative, as assigned.

UDOT's Resident Engineer for 9000 South and 11400 South interchanges is Ken Talbot, telephone number (801) 360-8750, and e-mail kentalbot@utah.gov, or their designated representative, as assigned.

UDOT's Field Representative contact person will be identified in subsequent supplemental agreements.

Company's contact person is Rob Williamson, telephone number (208) 338-2816, and e-mail rlwilliamson@att.com.

After awarding the Project, UDOT will provide the Company with the Design-Builder contact information, hereinafter referred to as "Design-Builder Third Party Manager".

2. AUTHORIZATION FOR DESIGN WORK

In order to facilitate coordination and obtain technical information about the Company's facilities and requirements for inclusion in this Agreement and the request for proposals, UDOT gave the Company authorization for preliminary design engineering on April 26, 2016.

3. SUBSURFACE UTILITY ENGINEERING

UDOT has performed Subsurface Utility Engineering (SUE) within the limits of the Project. Additional SUE work to determine the precise location of underground facilities at specific, critical locations on the Project will be reviewed with the Company.

4. PROJECT COORDINATION

Company and UDOT agree to have the Design-Builder include in the Project, items of Utility Work for the Company's facilities.

During the development of the Project design, the Company and UDOT, along with its Design-Builder, shall consult as necessary in an effort to determine if conflicts with the Company's facilities can be avoided. If Utility Work is required, UDOT will be responsible to propose and provide a location for the facilities. UDOT will provide the Company with Project design plans as early as possible, and will schedule and meet with the Company to review the design, construction, estimates of cost, and scheduling for the Company's Utility Work at specific locations

DRAFT

on the Project to ensure maximum lead time for advance order of materials and work force scheduling.

The Company shall advise UDOT's Project Representative of the approximate time required for completion of the Utility Work and shall diligently pursue its Utility Work so that completion can be accomplished according to the pre-determined time schedule negotiated by the Company and UDOT in the supplemental agreement issued hereto for a specific Project location. The Company shall immediately notify UDOT's Project Representative by phone call or email, of its discovery of any occurrence or unforeseen circumstances that would prevent the Company from completing its Utility Work according to the time schedule provided. In addition, the Company shall describe the circumstances in writing within 24-hours of the discovery to UDOT's Project Representative.

5. COMPANY REQUIREMENTS

UDOT will comply with the following Company Utility Work requirements:

a. The Company requires two 2 months per location to engineer Utility Work estimates.
b. Exercise all due caution while working near the facilities in order to prevent damage to the facilities.
c. To notify Company by telephone at (800) 252-1133 at least 48 hours prior to performing any construction, demolition or repairs at the facilities location.
d. To perform construction, demolition, repair, modifications, additions, and any other activities in compliance with all applicable laws and regulations and in a manner that does not interfere with the operations of Company.

6. UDOT TO DESIGN AND CONSTRUCT A PORTION OF UTILITY WORK

UDOT shall perform the necessary design work, cost estimating for its Utility Work, field and office engineering, furnish all materials (except cables and hand holds necessary to accommodate the Utility Work), and perform the Utility Work (except pulling and splicing), necessitated by the Project.

UDOT will design the Utility Work in accordance with Company's standards regularly followed by the Company in its own work and not considered a betterment. In the event of a conflict between UDOT and Company standards, the higher standard will be applied.

UDOT will secure permits required for Utility Work for Company's facilities.

UDOT shall protect existing facilities, including services, which are not to be relocated or adjusted, belonging to Company after notice to and in coordination with Company.

UDOT will supply as-constructed plans for the Utility Work it performs, in AutoCAD format, upon completion of any required Utility Work.

7. COMPANY TO PERORM INSPECTION AND CONSTRUCT A PORTION OF THE UTILITY WORK

The Company will perform inspection of the Utility Work for the Company's facilities that will be performed by UDOT. UDOT will accomplish the Utility Work on the Company's facilities in

DRAFT

accordance with the plans and specifications approved by the Company. Changes or additions to the plans and specifications shall be approved by the Company and UDOT through a supplemental agreement.

The Company will provide all cables, hand holds, pulling, and splicing, necessary to accommodate the Utility Work of its facilities on the Project. The Company requires 30 days' notice to schedule splicing and fiber pulls and will determine the splicing window based on the circuit.

8. STANDARD SPECIFICATIONS AND REGULATIONS

The Company, while engaged in the preliminary design and Utility Work of its facilities, shall comply with UDOT's 2012 Standard Specifications for Road and Bridge Construction and Utah Administrative Code R930-7.

9. UNDERBUILT AND FACILITY REMOVAL REQUIREMENTS

The Company is responsible to see to the removal of all Company-owned underbuilt facilities from utility poles that will be relocated or removed due to the Project.

10. RIGHT-OF-WAY

Any easements or replacement right-of-way required in conjunction with the Utility Work of Company's facilities will be acquired by UDOT in accordance with the requirements of Utah Administrative Code R930-8-7.

11. MAINTENANCE OF TRAFFIC (MOT), TRAFFIC CONTROL, CLEAR/GRUB, AND SURVEYING

UDOT will provide MOT and traffic control for Utility Work at no cost to the Company. The Company is responsible to coordinate Utility Work schedules and traffic control needs with UDOT to facilitate the Project schedule and minimize impacts to the public. Except in the case of emergencies, Company's Utility Work on the Project will be scheduled in compliance with the requirements of the Limitation of Operations contained in UDOT's Design-Builder contract with respect to lane closures, peak hour Utility Work restrictions, holiday and special event limitations, etc.

UDOT will provide, at no cost to the Company, clearing and grubbing for the Utility Work as required by the Company and in accordance with UDOT's Standard Specifications.

Surveying and staking of roadway facilities as required by the Company will be provided by UDOT in accordance with UDOT's Standard Specifications. The cost of the surveying and staking will be at UDOT's expense and the Company will have no obligation for the cost of surveying. Any of UDOT's survey control stakes or bench markers, which are removed or damaged by the Company, shall be reestablished by UDOT at Company's expense.

12. BETTERMENT WORK

If the Company desires to include betterment work in the Project at any specific location, UDOT may agree to the betterment work providing the difference in costs between the functionally

DRAFT

equivalent required Utility Work and the Company's desired betterment work, that is not required by the Project, shall be at the sole cost of the Company and the betterment work can reasonably be accommodated without delaying UDOT's Project. The betterment work will be addressed by a separate supplemental agreement between UDOT and the Company.

Once a Design-Builder has been selected by UDOT, any betterment work request will be negotiated directly with the Design-Builder. However, it is at UDOT's sole discretion to approve the betterment work.

13. SUPPLEMENTAL AGREEMENTS

UDOT and the Company shall enter into individual supplemental agreements to cover Utility Work at specific Project locations. Each supplemental agreement will include a description and location of the Utility Work to be performed, design drawings showing the original and proposed locations of the Company's facilities, Utility Work schedules, cost estimates from all Parties, participation shares for UDOT and the Company, any proposed betterment work, and any necessary right-of-way documents. The estimates do not account for increases due to unknown and unforeseen hardships in accomplishing the Utility Work. A copy of the format of the proposed supplemental agreement is marked Exhibit "A" that is incorporated by reference.

The Company will require a 2 week review and approval period for any final supplemental agreement submitted to the Company by UDOT.

In the event there are changes in the scope of the Utility Work, extra Utility Work, or changes in the planned Utility Work covered by a supplemental agreement, a modification to the supplemental agreement approved in writing by the Parties is required prior to the start of Utility Work on the changes or additions.

14. UDOT AUTHORIZATION TO PROCEED WITH UTILITY WORK

The Company shall not perform any Utility Work until the supplemental agreement for the Utility Work is signed by the Company and received by UDOT. UDOT will review and approve the supplemental agreement and will issue an authorization to proceed to the Company for each specific Utility Work location.

15. UDOT TO NOTIFY THE COMPANY BEFORE BEGINNING UTILITY WORK

UDOT will notify the Company at least 2 business days in advance of beginning any Utility Work covered by any supplemental agreements hereto, to allow the Company time to schedule an inspector to be present during the Utility Work. Subsequent notification of when and where Utility Work will be performed will be given on a day-to-day basis. Should UDOT fail to give advance notification and Utility Work is performed without the presence of a Company inspector, UDOT will, at no cost to the Company, facilitate inspection of the Utility Work including, if necessary, uncovering the Utility Work.

16. COMPANY TO NOTIFY UDOT AND THE DESIGN-BUILDER BEFORE BEGINNING COMPANY PERFORMED UTILITY WORK

The Company will notify UDOT's Project Representative as well as the Design-Builder Project Representative at least 2 business days in advance of beginning any Utility Work covered by any supplemental agreements hereto. The Company will give subsequent notifications of when

DRAFT

and where the Company will be performing Utility Work to UDOT's Field Representative and the Design-Builder Project Representative on a day-to-day basis. Such subsequent notifications can be informal. Failure on the part of the Company to give proper notification to UDOT's Field Representative and the Design-Builder Project Representative will be cited to the Company and that portion of the Company's Utility Work performed while not under the surveillance of the UDOT Field Representative may be deducted from the reimbursement at UDOT's discretion for.

17. INSPECTION

The Company shall provide on-call engineering support by the Company's engineer or appropriate representative for design review, schedule coordination, or to correct or clarify issues during the Utility Work, and to perform the necessary inspection for the Company's Utility Work installed by UDOT.

a. The Company engineer and/or inspector shall work with and through UDOT's Project Representative and shall give no orders directly to UDOT's Design-Builder unless authorized in writing to do so. UDOT will accomplish the Utility Work covered herein on Company's facilities in accordance with the plans and specifications provided and/or approved by the Company, including changes or additions to the plans and specifications, which are approved by the Parties hereto.
b. The Company shall immediately notify UDOT's Project Representative and the Design-Builder Project Representative of any deficiencies in the Utility Work on the Company's facilities. The Company shall follow up with written detail to UDOT's Project Representative and the Design-Builder Project Representative of its findings within 24-hours of making its initial notification.
c. UDOT will respond to the Company's concerns within 24-hours of written notification.
d. The Company, through its inspection of the Utility Work, will provide UDOT's Project Representative with information covering any problems or concerns the Company may have with acceptance of the facilities upon completion of the Utility Work.
e. Any periodic plan and specification review or construction inspection performed by UDOT arising out of the performance of the Company's Utility Work does not relieve the Company of its duty in the performance of the Utility Work or to ensure compliance with acceptable standards.

18. DAILY RECORDKEEPING

UDOT's Field Representative, will keep daily records of the inspection and Utility Work performed by the Company forces. Daily records will be in duplicate on a form to be prepared by the Company or UDOT. The type of form to be used shall be preapproved by UDOT's Contracts, Compliance, and Certification Manager. The daily records shall be signed by UDOT's Field Representative, the Company or its authorized representatives.

19. REIMBURSEMENT FOR COMPANY'S UTILITY WORK

In accordance with Utah Code §72-6-116(3)(a)(ii), UDOT will reimburse the Company 50% of the cost of Utility Work of its facilities on state highways and the Company shall pay the remainder of the cost of the Utility Work. UDOT will reimburse the Company 100% of the cost of Utility Work of its facilities located on a public utility easement, on a Company-owned private easement or fee property. The Company shall provide UDOT with a copy of the public utility easement or subdivision plat, private easement or fee title. The Utility Work and reimbursement

DRAFT

for Company's facilities required by the Project will be in conformance with the requirements of Utah Administrative Code R930-8.

The Company shall submit itemized bills covering its actual costs incurred for performing the Utility Work covered by supplemental agreements to UDOT's Contracts and Compliance Specialist:

UDOT Contracts and Compliance Specialist
4501 South 2700 West
Construction Office, Box 148220
Salt Lake City, Utah 84114-8220

Itemized bills shall bear the Project and supplemental agreement numbers, supporting sheets, and a complete billing statement of all actual costs incurred, following the order of the items in the detailed estimates contained in the supplemental agreement, and be submitted to UDOT within 60 days following completion of the Utility Work by the Company on the Project. Otherwise, previous payments to the Company may be considered final, except as agreed to between the Parties in advance. UDOT will reimburse the Company within 60 days after receipt of the billings, but only for those items complying fully with the provisions of Utah Administrative Code R930-8. Failure on the part of the Company to submit final billings within 6 months of the completion of the Utility Work will result in UDOT's disallowance of that portion of Utility Work reimbursement.

If the Company owes a balance to UDOT, the Company will reimburse UDOT within 60 days after receipt of billing from UDOT.

20. SALVAGE CREDIT

In accordance with 23 C.F.R. §645.117 all materials from Company's existing facilities which are recovered by UDOT while performing the Utility Work and not reused on this Project shall become the property of the Design-Builder unless otherwise agreed to in advance by the Parties hereto.

In accordance with 23 C.F.R. §645.117, all materials from the existing facilities, which are recovered in suitable condition for reuse by the Company and not reused on the Project, shall be credited to the cost of the Project at current stock prices. If the materials are not suitable for reuse, they shall be credited at such other prices as agreed upon between the Company and UDOT following inspection of the recovered material.

21. PROJECT DESIGN CHANGES

If UDOT changes the Project design after the Company has completed its design review; or if the Company has completed its portion of the Utility Work of its facilities based on previously approved design plans; the cost of the second design review and/or Utility Work is to be paid in full by UDOT. UDOT will make adjustments for any additional time that may be required for the Company to perform Utility Work on its facilities when required.

22. COMPANY'S COSTS DIFFER BY MORE THAN 10%

If the Company's actual costs incurred for its force account work differs more than 10% plus or minus per line item from the amount contained in the supplemental agreements, the

DRAFT

Company is required to submit a letter of explanation with its billings indicating how and why the difference in costs occurred.

23. **RIGHT TO AUDIT**

UDOT and FHWA shall have the right to audit all cost records and accounts of the Company pertaining to this Project in accordance with the auditing procedure of the Federal Highway Administration and 23 C.F.R. §645, subpart A. Should this audit disclose that the Company has been underpaid, UDOT will reimburse the Company within 60 days upon submission of additional billing to cover the underpayment. Should this audit disclose that the Company has been overpaid, the Company will reimburse UDOT within 60 days of notification of audit findings in the amount of the overpayment. For the purpose of audit the Company is required to keep and maintain its records of Utility Work covered herein for a minimum of 3 years after final payment is received by the Company from UDOT.

The Company shall have the right to review UDOT's cost documentation for the Utility Work performed on behalf of the Company.

24. **ACCEPTANCE**

UDOT will provide notification to the Company for acceptance of the Utility Work upon completion of the final inspection. Company will have 60 days to respond in writing to UDOT with any additional comments in regards to the Utility Work. In the event that UDOT does not receive a written response within 60 days, UDOT will designate the Utility Work accepted by the Company. Upon acceptance of the Utility Work, the Company will accept, own and maintain its facilities. To the extent it may lawfully do so, Company further agrees to relieve UDOT from any responsibility or liability that may result for its new facilities or the operation thereof.

25. **ACCESS & MAINTENANCE**

Access for maintenance and servicing of Company's facilities located on the Project right-of-way will be allowed only by permit issued by UDOT. Company will obtain the permit and abide by conditions thereof for policing and other controls in conformance with Utah Administrative Code R930-7.

26. **FORCE MAJEURE**

An event of force majeure is an unforeseeable event or circumstance which is beyond the control and without the fault or negligence of the party affected and which by the exercise of reasonable diligence the party affected was unable to prevent, which by way of illustration can include, but is not limited to the following:

a. riot, war, invasion, act of foreign enemies, hostilities, acts of terrorism, civil war or rebellion;

b. tornados, earthquakes, flood, fire or other physical natural disaster; and

c. strikes at a national level or industrial disputes at a national level, or strike or industrial disputes by labor not employed by the affected party, its subcontractors or its suppliers and which affect an essential portion of the works but excluding any industrial dispute

DRAFT

which is specific to the performance of the utility relocation or this Agreement.

Neither party is responsible for any failure to perform its obligations under this Agreement if it is prevented or delayed in performing those obligations by an event of force majeure. Only those obligations directly affected by an event of force majeure are excused. Where there is an event of force majeure, the party prevented from or delayed in performing its obligations in this Agreement must immediately notify the other party giving full particulars of the event of force majeure preventing that party from, or delaying that party in performing its obligations in this Agreement and that party must use its reasonable efforts to mitigate the effect of the event of force majeure upon its performance of the contract and to fulfill its obligations.

Upon completion of the event of force majeure, the party affected must as soon as reasonably practicable recommence the performance of its obligations in this agreement. If the effected party is the Company, the Company must provide a revised schedule to minimize the effects of the prevention or delay caused by the event of force majeure.
UDOT shall not be responsible for any costs or losses to the Company caused by the event of force majeure.

27. **MISCELLANEOUS**

a. Each Party agrees to undertake and perform all further acts that are reasonably necessary to carry out the intent and purpose of this Agreement at the request of the other Party.

b. This Agreement in no way creates any type of agency relationship, joint venture, or partnership between UDOT and Company.

c. The failure of either Party to insist upon strict compliance of any of the terms and conditions, or failure or delay by either Party to exercise any rights or remedies provided in this Agreement, or by law, will not release either Party from any obligations arising under this Agreement.

d. This Agreement shall be deemed to be made under and shall be governed by the laws of the State of Utah in all respects. Each person signing this Agreement warrants that the person has full legal capacity, power, and authority to execute this Agreement for and on behalf of the respective Party and to bind such Party. This Agreement may be executed in one or more counterparts, each of which shall be an original, with the same effect as if the signatures were made upon the same instrument. This Agreement may be delivered by facsimile or electronic mail.

SUPPLEMENTAL AGREEMENT NO. ___

Supplement to UDOT Finance No. _____

THIS SUPPLEMENTAL AGREEMENT, made and entered into this _____ day of _____, 20____, **Utah Department of Transportation**, ("UDOT"), and **AT & T**, a Registered Corporation of the State of New York licensed to operate in the State of Utah, ("Company") each as ("Party") and jointly as ("Parties").

The Parties hereto entered in to a Master Utility Agreement (MUA) dated _____, UDOT Finance No. _____. All the terms of the MUA remain in full force and effect unless otherwise specified herein.

The Parties agree as follows:

UDOT and Company will perform the following described Utility Work in accordance with the terms and conditions of the MUA:

a. Description of Utility Work to be performed, including proposed location, described in Exhibit "A" that is incorporated by reference: (Plan Sheets Attached)

b. The Company requirements as shown in the MUA – Company Requirements, are modified as follows:

c. Anticipated duration of Utility Work as shown on Exhibit "B" that is incorporated by reference:

d. Betterments included:

TOTAL ESTIMATED COST OF SUPPLEMENTAL AGREEMENT _____	**$0.00**
TOTAL ESTIMATED COST OF COMPANY PERFORMED UTILITY WORK	$0.00
TOTAL ESTIMATED COST OF UDOT PERFORMED UTILITY WORK	$0.00
COMBINED TOTAL ESTIMATED COST OF UTILITY WORK	**$0.00**
TOTAL ESTIMATED AMOUNT OF COMPANY PARTICIPATION @ 50%	$0.00
TOTAL ESTIMATED AMOUNT OF UDOT PARTICIPATION @ 50%	$0.00

2. UDOT will notify the Company's contact person, Rob Williamson, Telephone No. (208) 338-2816, email rlwilliamson@att.com at least 48 hours in advance of beginning the Utility Work covered herein, or in accordance with the specific terms of the MUA, as applicable.

STATEWIDE UTILITY RELOCATION AGREEMENT

E 20832

THIS STATEWIDE UTILITY RELOCATION AGREEMENT, made and entered into this 1st day of April, 2014, by and between the **UTAH DEPARTMENT OF TRANSPORTATION**, hereinafter referred to as **"UDOT"** and Qwest Corporation dba CenturyLink QC (**CENTURYLINK)**, a Registered Corporation in the State of Colorado, and on behalf of itself and its affiliates, hereinafter referred to as the **"COMPANY."**

RECITALS:

WHEREAS, UDOT has jurisdiction over state Highway Rights of Way and administers the programming, development and completion of State and Federal highway projects (referred to herein as Project or collectively as Projects); and

WHEREAS, the **COMPANY** is a telecommunication utility owning and operating cable and fiber optic and related facilities (Facilities), within state highway rights-of-way under Statewide License Agreement and within **COMPANY** owned easements and fee title property; and

WHEREAS, certain highway Projects will require the relocation, adjustment, or protection of **COMPANY** Facilities; and

WHEREAS, for the purpose of expediting the performance and reimbursement of required relocation work on State and Federal Aid Highway Projects, it is the desire of the parties to enter into this Statewide Utility Relocation Agreement (Agreement) with the understanding that the parties will enter into future Project Agreements, which are supplemental to this Agreement, to address the scope of work, schedule, and other requirements for specific Projects; and

WHEREAS, this Agreement**,** along with the Project Agreements supplemental hereto, is made to set out the terms and conditions that will govern the relocation work.

TERMS:

1. PROJECT AGREEMENTS

A. For each Project, **UDOT** will prepare a Project Agreement. All terms in the Project Agreements shall be supplemental to the terms of this Agreement. In the case of an inconsistency between the terms of this Agreement and the terms of a Project Agreement, the terms of the Project Agreement shall control. In some cases, particularly when **UDOT** engages a design builder or a construction manager general contractor, the parties may enter into Supplemental Agreements to the Project Agreement. The Project Agreements and Supplemental Agreements should address utility relocation work for specific Project locations and include a description of the work, the party to perform the work, the location of the work, review times, the estimated duration of the work, scheduled completion date, an estimate of the cost to each party, any proposed betterments, including a plan showing the existing and proposed locations of the Facilities, and any necessary right-of-way documents as applicable. The estimates contained in the Project Agreements will be based upon material and labor prices as of the date of the estimate and do not account for increases due to unforeseen circumstances in accomplishing the relocation work.

B. The parties hereto agree to use a form Project Agreement to describe and perform the actual work on individual Projects, a copy of which is marked "EXHIBIT B" attached hereto and thereby made a part hereof.

2. PROJECT DEVELOPMENT AND COORDINATION

A. During the design phase of any Project, **UDOT** and **COMPANY** will identify the extent of the conflicts and propose and provide a mutually agreeable location to which the Facilities can be relocated. **UDOT** will provide the **COMPANY** with Project design plans as early as possible, and will schedule and meet with the **COMPANY** to review the right-of-way and environmental requirements, design, construction, cost estimates, and scheduling for the **COMPANY's** utility relocation work at specific locations on the Project to ensure maximum lead time for advance order of materials and scheduling of work force.

B. **COMPANY** shall advise **UDOT** of the approximate time required for completion of the Relocation Work and all known limitations including permit and regulatory approvals, dependency upon work of other parties, lead times for acquiring materials, notifications, and scheduling work crews. **UDOT** will, by its standard specifications and/or special provisions, make its contractor aware of the coordination and cooperation required for timely completion of utility work. **UDOT**'s contractor shall be advised of the approximate schedule for completion of said work and the **COMPANY** shall diligently pursue its work so that completion can be accomplished according to an agreed upon schedule, and as soon as possible after having been authorized to proceed.

C. If either party or their contractors intend to implement a redesign, scope or schedule change, **UDOT** and **COMPANY** shall meet in advance and coordinate to identify the change and the potential impact to both parties, including but not limited to costs and scheduling.

D. The **COMPANY** shall notify **UDOT**, or its contractor if so designated by **UDOT**, within seventy two (72) hours of its discovery of any occurrence or unforeseen circumstances that would prevent the **COMPANY** from completing the Relocation Work according to the time schedule established in the Project Agreement.

E. For Projects subject to federal Buy America requirements, as determined by **UDOT**, materials composed predominantly of iron or steel that are permanently incorporated into the work are subject to 23 CFR 635.410, Buy America requirements. **COMPANY** will provide **UDOT's** Resident Engineer with signed Buy America Certifications prior to or at the time subject materials are delivered to the project site, according to the specific instructions and format set forth in the attached Exhibit A.

3. DESIGN BUILD PROJECTS

A. During the proposal phase of any design build Project, **UDOT** shall schedule a meeting with **COMPANY** and **UDOT's** prospective contractors. The purpose of the meeting will be to determine if conflicts with the **COMPANY's** Facilities can be avoided and to provide prospective contractors with parameters within which **COMPANY's** Facilities can be relocated. **COMPANY** and **UDOT** will also meet one time individually with each prospective contractor.

B. All provisions of this Agreement apply to Design Build Projects unless stated otherwise.

4. BETTERMENT WORK

If the **COMPANY** desires to include a betterment in the utility work at any specific location, **UDOT** will allow for betterment work to be performed, provided the parties can reasonably coordinate the Project schedule to accommodate the betterment work without increasing Project costs or delaying the Project. Betterment is defined as set forth in 23 CFR 645, Section 645.105, Definitions. Specifically, betterment is any upgrading of the facility being relocated that is not attributable to the highway construction and is made solely for the benefit of and at the election of the **COMPANY**. Any upgraded facility due solely to the lack of equivalent replacement does not constitute a betterment. The difference in costs between the minimum construction required as a result of the Project and the **COMPANY's** desired construction shall be at the **COMPANY's** sole expense. The actual costs for the **COMPANY's** participation shall be determined upon completion and final billing for the relocation work.

5. COMPANY REQUIREMENTS

A. The **COMPANY** is required to comply with all applicable service interruption notification times and restrictions required by their customer service contracts, the Public Service Commission, Public Safety Agencies, the Federal Aviation Administration, etc.

B. Existing fiber loops will not be cut to add additional splices. Replacement fiber will be placed between designated splice points, even if it extends beyond the project limits. Replacement copper will be placed from pedestal to pedestal. No buried splices will be allowed under new pavement sections. These requirements may be modified upon written agreement by the Parties.

6. UDOT PROJECT RESPONSIBILITIES

A. In accordance with current policies and directives, **UDOT** may perform Subsurface Utility Engineering, Quality Levels A and B, within the limits of a Project. Additional work required to determine the vertical location of underground Facilities at specific, critical locations will be reviewed and if test holes are required, such costs will be shared between the parties on the same basis of responsibility as described in Section 7. A summary of the costs will be provided to the **COMPANY,** and the **COMPANY's** proportional share of the actual cost will be withheld from the **COMPANY**'s relocation reimbursement.

B. If, during the design phase of a Project, a major scope change is implemented after **COMPANY**'s design has been finalized and approved, **COMPANY** will be reimbursed 100% for redesign costs. **UDOT** will adjust any existing schedules to allow for any reasonable time that may be required for the **COMPANY** to redesign or modify its plans and relocate its Facilities when **UDOT** or its contractors requires the redesign.

C. **UDOT,** through its contractors, will provide surveying and staking of roadway facilities as required by the **COMPANY,** in accordance with **UDOT's** Standard Specifications, Section 01721, Survey, 3.16, Utilities. The cost of the surveying and staking will be at **UDOT**'s expense and will not be recovered from the **COMPANY**. Any of **UDOT**'s survey control stakes or bench markers which are removed or damaged by the **COMPANY** shall be reestablished by **UDOT** at **COMPANY's** expense.

D. **UDOT** will require its contractors to protect in place any existing facilities belonging to the **COMPANY**, including services, which, with the concurrence of the **COMPANY**, will not be relocated or adjusted during the proposed construction activities.

E. If, during the construction phase, **UDOT**'s contractor is allowed to accelerate the agreed upon baseline or proposal schedule, **UDOT** will hold the contractor responsible for 100% of the cost for a **COMPANY** approved contract engineer to perform tasks needed to meet the accelerated schedule which exceeds the **Company's** anticipated engineering schedule.

F. **UDOT** will require its contractor to reopen any splice pits the contractor covered prior to **COMPANY** crews completing splicing activities at no cost to the **COMPANY**, provided **COMPANY** is following their work schedule as agreed upon by **UDOT** and **COMPANY**.

7. COMPANY TO DESIGN AND CONSTRUCT UTILITY WORK

A. The **COMPANY**, with its regular engineering and construction forces at its standard schedule of wages and working hours, or through its qualified contractors with whom it has continuing contracts or has obtained contracts upon appropriate solicitation, will perform the necessary design work, field and office engineering, and shall furnish all materials and perform the construction work on its Facilities, necessitated by the Project. In performance of said work, the **COMPANY** and its contractors will adhere to the requirements of Utah Administrative Code R930-7 Utility Accommodation, as amended.

B. The **COMPANY** is required to meet clear zone requirements as defined in AASHTO's "Roadside Design Guide" and minimum vertical and horizontal clearances as defined in R930-7 Utility Accommodation, as amended.

C. The **COMPANY**, while engaged in the relocation of its Facilities, shall comply with **UDOT's** Standard Specification for Road and Bridge Construction Section 01355, Subpart 1.13, Discovery of Historical, Archeological or Paleontological Objects, if performing work within UDOT's right-of-way.

D. **COMPANY** provided traffic control devices shall conform to the standards set forth in the Manual on Uniform Traffic Control Devices ("MUTCD"), as adopted by **UDOT**. All flagging personnel shall be certified.

E. **COMPANY** employees and contractors working in the highway right-of-way shall comply with requirements of MUTCD Section 6D.03. concerning high-visibility safety apparel, as amended.

8. UDOT MAY DESIGN AND CONSTRUCT CERTAIN UTILITY FACILITIES

A. The **COMPANY** will perform design review and cost estimating; provide electronic equipment and splicing; and perform inspection with its own forces. The **COMPANY** may, at its discretion, allow **UDOT** to perform relocation design and/or construction work through qualified engineering and construction contractors appearing on the **COMPANY's** current preapproved list to perform the Utility Work, necessitated by a Project. If conduit, cable, fiber, pedestals and placing of such are required for the Utility Work, **UDOT** will obtain the materials from the contractors on the **COMPANY's** preapproved list. The **COMPANY** makes no representations as to the quality of work performed by the engineers and construction contractors on the **COMPANY's** preapproved list.

B. The **COMPANY** will require a four (4) week period after proposed design plans are delivered to the **COMPANY**, to review **UDOT**'s engineer's or contractor's design plans and the **COMPANY**'s pricing, and for internal approvals**. UDOT,** or its engineer or contractor shall provide to **COMPANY,** design plans in the following two (2) formats: (1) a civil engineered design package and (2) a format consistent with **COMPANY**'s internal telecommunications record keeping system. The **COMPANY** will approve the relocation plans and cost estimates in writing before incorporation into the Project or Supplemental Agreements.

C. **UDOT's** engineer or contractor will be required to provide the **COMPANY** with a schedule for the completion of their performed work before the **COMPANY** can prepare and submit a schedule for their performed work.

D. The **COMPANY** will perform inspection of the work on the **COMPANY's** facilities that will be performed by **UDOT**'s contractor. It is agreed that **UDOT**'s contractor will accomplish the work on the **COMPANY's** facilities in accordance with the plans and specifications approved by the **COMPANY**. Changes or additions to said plans and specifications shall be approved by the **COMPANY**. The **COMPANY** through their inspection of the contractor's work, will provide **UDOT's** Resident Engineer with information covering any problems or concerns the **COMPANY** may have with acceptance of said Facilities upon completion of construction.

E. The **COMPANY** will require two (2) business days notice to schedule a construction inspector for each location.

F. The **COMPANY** requires at least ninety (90) days notice to schedule splicing, and will determine the splicing window based on the types of circuit(s) and the requirements of Home Land Security and the Federal Aviation Administration (FAA).

G. If **UDOT's** contractor will be installing betterment facilities for the **COMPANY**, the Contractor will provide the **COMPANY** with a schedule of prices or a price breakdown for any betterment work requested. If the cost of the betterment work is not within 15% of the standard **COMPANY** costs, **COMPANY** will be allowed to have one of its approved contractors perform the betterment work in accordance with Paragraph 4 of this agreement. If **COMPANY's** contractor is to place the betterment, UDOT's contractor will grant reasonable access to open trenches and any area within the project limits required to construct the betterment, as determined by UDOT.

9. CHANGES IN WORK

In the event there are changes in the scope of the work, extra work, or changes in the planned work covered by this Agreement or Project Agreement, a modification will be approved in writing by the parties thereto prior to the start of work on said changes or additions.

10. COMPANY TO NOTIFY UDOT AND ITS CONTRACTOR BEFORE BEGINNING CONSTRUCTION WORK

The **COMPANY** will notify **UDOT's** Resident Engineer or authorized representative as identified in the Project Agreement at least 48 hours in advance of beginning any work. Such notification can be by telephone, email or in writing.

11. EMERGENCY WORK

When the **COMPANY** experiences an emergency unrelated to its work on the highway Project, it will take care of said emergency, after which it will again notify **UDOT** as to when work will be resumed on the Project.

12. DAILY RECORD KEEPING

UDOT, through its Resident Engineer or authorized representative, will keep daily record of the work performed by the **COMPANY**. The daily record shall be signed by **UDOT's** Project representative and the **COMPANY** or their authorized representatives as required and a copy shall be retained by the parties to this Agreement. If emergencies occur requiring the **COMPANY's** work forces to leave the job, record keeping shall be resumed upon return to the Project.

13. REIMBURSEMENT FOR COMPANY'S WORK

A. Pursuant to Utah Code Section 72-6-116, as amended, **UDOT** will reimburse the **COMPANY** 50% of the cost of all **COMPANY** costs related to the relocation work for its Facilities within State right-of-way, and 100% of the cost of all **COMPANY** costs related to the relocation work for its Facilities located within **COMPANY** owned easement, fee property or a public utility easement as defined in Section 54-3-27.

If the **COMPANY**'s Facilities are relocated from a **COMPANY** owned easement, fee title or public utility easement to State right-of-way and the **COMPANY** transfers its property interest without cost to **UDOT**, **UDOT** will reimburse the **COMPANY** 100% of the relocation costs caused by **UDOT**'s projects in the future.

B. Reimbursable costs will be developed in accordance with 23 CFR, Part 645, Subpart A.

C. The **COMPANY** will submit itemized bills covering its actual costs incurred for performing the work covered by the Project Agreements hereto, bearing the Project number together with supporting sheets on a monthly or quarterly basis.

D. **COMPANY** will also send one final and complete billing of all actual costs incurred within six months following completion of the work by the **COMPANY** on the Project to:

UDOT Contracts, Estimates and Agreements Specialist
4501 South 2700 West, Box 148220
Salt Lake City, Utah 84114-8220

E. In the event **COMPANY** fails to send a final bill to **UDOT** within six months of completion of **Company** work, **UDOT** may send notice to **COMPANY** requesting a final bill. **COMPANY** will have 45 days to respond with a final bill or will forfeit payment for the unbilled portion of the work. Both parties agree to cooperatively work together in good faith to resolve any disputes on the final billing within sixty (60) days after UDOT receives the final bill from **COMPANY**.

F. **UDOT** will reimburse the **COMPANY** within sixty (60) days after receipt of said billings but only for items complying fully with the provisions of 23 CFR, Part 645, Subpart A, Utility Relocations, Adjustments and Reimbursements. **UDOT** will provide a written explanation of any billings not reimbursed and the **COMPANY** shall have thirty (30) days from the date of such explanation to cure any deficiencies and re-submit to **UDOT**.

14. SALVAGE CREDIT

All materials from the existing **COMPANY** Facilities, which are recovered in suitable condition for reuse by the **COMPANY** and not reused on the Project, shall be credited to the cost of the Project at current stock prices in accordance with 23 CFR 645.117. If the recovered materials are not suitable for reuse, they shall be credited at salvage prices or such other prices as agreed upon between the **COMPANY** and **UDOT** following inspection of the recovered material.

15. COSTS DIFFER BY MORE THAN TEN PERCENT

If **COMPANY's** actual costs incurred for its reimbursable work differs more than 10% (plus or minus) per line item from the amount contained in the Project Agreement Cost Estimate, then **COMPANY** is required to submit a letter of explanation with its billings indicating why and how said difference in costs occurred.

16. AUDIT

UDOT and/or the Federal Highway Administration shall have the right to audit all cost records and accounts of the **COMPANY** pertaining to the Project in accordance with 23 CFR, Part 645, Subpart A. Should this audit disclose that the **COMPANY** has been underpaid, the **COMPANY** will be reimbursed by **UDOT** upon submission of additional billing to cover the underpayment. Should this audit disclose that the **COMPANY** has been overpaid, the **COMPANY** will reimburse **UDOT** in the amount of the overpayment. For the purpose of audit the **COMPANY** is required to keep and maintain its records of work covered herein for a minimum of three years after final payment is received by the **COMPANY** from **UDOT**.

17. MISCELLANEOUS

A. In the event of any dispute relating to this Agreement, resulting in litigation, the prevailing party shall be entitled to recover all costs, including reasonable attorney fees.The provisions of this Agreement are severable, and should any provision be deemed void, unenforceable or invalid, such provision shall not affect the remainder of this Agreement.

B. This Agreement shall be governed by the laws of the State of Utah and applicable federal law. Any litigation shall be instituted only in a court of competent jurisdiction, whether state or federal, located within the State of Utah.

C. This Agreement may be terminated by either party by providing 30 day written notice of termination to the other party. Any such termination shall not affect the validity of any previously executed Project Agreements or any other agreements supplemental to this Agreement.

****

IN WITNESS WHEREOF, the parties hereto have caused this Agreement to be executed by their duly authorized officers as of the day and year first above written.

Exhibit A
BUY AMERICA

Federal-aid projects are subject to Title 23 CFR Part 635.410, Buy America Requirements. This federal regulation requires a domestic manufacturing process for all steel or iron products that are permanently incorporated into federal-aid highway construction projects. This includes relocation projects performed by utility companies and reimbursed by the Utah Department of Transportation. This exhibit establishes the required documentation and Utility Company responsibilities to demonstrate compliance with this federal law. A copy of the federal regulation can be found at: http://www.fhwa.dot.gov/construction/contracts/buyam_qa.cfm

A. All products predominantly manufactured from steel and iron must be manufactured in the United States to be considered domestic.

1. All manufacturing processes of the steel and iron material in a product such as melting, rolling, extruding, machining, bending, grinding, drilling, and coating must occur within the United States.
2. Coating includes all processes that protect or enhance the value of the material to which the coating is applied. The material applied as a coating is not subject to Buy America.

B. Maintain Material Certifications of Compliance for each manufacturing and coating process for three (3) years after delivery to project site. Upon request provide access to these documents to the Utah Department of Transportation and the Federal Highway Administration.

1. Include as a minimum the following information for Material Certifications of Compliance for Buy America:
   a. Signed mill test report.
   b. Signed certification by each Fabricator and Manufacturer that has handled the steel or iron product affirming that every process, including the application of a coating, performed on the steel or iron product has been carried out in the United States.
   c. Material descriptions, quantities, and means of material identification such as heat numbers, lot numbers, and other industry identification markings for each process the material underwent so the final product can be tracked through a step process from melting to final product.
   d. Tracking of quantities is not required for coating operations.

2. Include all steel or iron materials that can't be substantiated as being of domestic origin in cost documentation for foreign steel or iron.

C. The above requirement does not preclude a minimal use of foreign steel or iron, provided the cost of the steel or iron used does not exceed one tenth of one percent (0.1 percent) of the total contract amount or $2,500, whichever is greater. The contract referenced here is the contract between the Utah Department of Transportation and the Utility Company. Maintain satisfactory cost documentation to describe the minimal use materials being incorporated into the project when foreign steel or iron is used.

D. The following are exempt from Buy America:
1. Temporary steel or iron materials.
2. Materials left in place for the contractor's convenience
3. Nuts, bolts, washers, screws, tie wire, spacers, and other miscellaneous steel or iron parts that are considered common off-the-shelf products.
4. Fencing stays, clips, staples, or other miscellaneous fencing components.
5. Manufactured products that are less than 90% steel or iron content by volume when it is delivered to the job site for installation. Pre-cast concrete items such as pipe, manholes, boxes and vaults still need to meet the Buy America requirements.
6. Miscellaneous steel or iron components, subcomponents and hardware necessary to encase, assemble and construct predominately steel or iron products are not subject to Buy America requirements. These miscellaneous items include but are not limited to, lifting hooks, concrete chairs, cabinets, covers, shelves, clamps, fittings, and sleeves.

E. Provide a written Company Certification (using the included form below) that all delivered steel and iron items subject to Buy America as defined above are manufactured domestically.

COMPANY CERTIFICATION

Certification Requirement for 23 CFR 635.410 Buy America

This project will be utilizing federal funds. Please complete, sign and submit this Buy America Certification to UDOT's Resident Engineer prior to or at the time subject materials are delivered to the project site.

Buy America Certification

I certify that all materials provided for use on Federal Aid Highway Project #_____, except for minimal use materials, meet the requirements of 23 CFR 635.410 Buy America and any amendments thereto. Material Certificates of Compliance for each manufacturing and coating process performed during the production of these materials are on file and will be made available for review by the Utah Department of Transportation and the Federal Highway Administration upon request.

PROJECT AGREEMENT

Supplement to Statewide Utility Relocation Agreement, Finance No. XXXXXX

THIS PROJECT AGREEMENT, made and entered into this_____ day of _____, 20_____, by and between the **UTAH DEPARTMENT OF TRANSPORTATION**, hereinafter referred to as **"UDOT"** and **QWEST CORPORATION DBA CENTURYLINK QC**, a Registered Corporation in the State of Colorado, hereinafter referred to as the **"COMPANY",**

The parties hereto entered in to a **STATEWIDE UTILITY RELOCATION AGREEMENT** dated _____ **UDOT** Finance No. XXXXXX. All the terms of said **STATEWIDE AGREEMENT** remain in full force and effect unless otherwise specified herein.

NOW THEREFORE, it is agreed by and between the parties hereto as follows:

1. The **COMPANY** will perform the following described work in accordance with the terms and conditions of the **STATEWIDE UTILITY RELOCATION AGREEMENT.**

   Description of work to be performed, including location:

   (Plan Sheets and Right of Way Documents, if applicable, attached)

   Party performing the work:

   Anticipated duration of work:

   Estimated Total Cost of Work:
   (Detailed Estimate attached)

Project No. _____; _____ County
Project Name:_____
CenturyLink
Job No. _____
CID No. _____ PIN _____

Betterments Included:

2. **UDOT** will perform the following described work in accordance with the terms and conditions of the **STATEWIDE UTILITY RELOCATION AGREEMENT.**

   Description of work to be performed, including location:

3. Work to be completed under this Project Agreement is subject to the following:

   Special Provisions

   -
   -
   -

4. The **COMPANY** shall be reimbursed by **UDOT** for XXX% of the actual costs incurred by the **COMPANY** for performing the work covered herein. An Estimate of the total cost of said work was furnished by the **COMPANY** to **UDOT** under date of _____ in the total amount of _____Dollars ($_____). A copy of the details of said estimates are marked "EXHIBIT A" attached hereto and thereby made a part hereof.

   TOTAL ESTIMATED COST TO UDOT IS $_____

   TOTAL ESTIMATED COST TO THE COMPANY IS $_____

   NOTE: The above are estimates only. Total payment to the **COMPANY** by **UDOT** will be based on the actual costs incurred as determined after completion of construction.

5. Upon signature and return of four copies of this Project Agreement to **UDOT**, the **COMPANY** is authorized to proceed with the work covered herein.

PROJECT AGREEMENT

Supplement to Statewide Utility Relocation Agreement, Finance No. 158015

THIS PROJECT AGREEMENT, made and entered into this_____ day of _____, 20___, by and between the **UTAH DEPARTMENT OF TRANSPORTATION**, hereinafter referred to as **"UDOT"** and **QWEST CORPORATION DBA CENTURYLINK QC**, a Registered Corporation in the State of Colorado, hereinafter referred to as the **"COMPANY."**

The parties hereto entered in to a **STATEWIDE UTILITY RELOCATION AGREEMENT** dated April 2, 2014, **UDOT** Finance No. 158015. All the terms of the **STATEWIDE UTILITY RELOCATION AGREEMENT** remain in full force and effect unless otherwise specified herein.

NOW THEREFORE, it is agreed by and between the parties hereto as follows:

1. PROJECT INFORMATION

UDOT is preparing to request proposals for and award a design-build contract for the highway project identified as S-0154(12)11, Salt Lake County, 4 Interchanges on Bangerter Highway hereinafter referred to as the "Project". UDOT's design-build contractor will complete the design and administer construction of the Project. The project contractor will hereinafter be referred to as the "Design-Builder".

2. PROJECT CONTACT INFORMATION

UDOT's Project Representative is Alana Spendlove, UDOT Project Utility and Railroad Leader, telephone number (801) 887-3462 and e-mail aspendlove@utah.gov.

UDOT's Resident Engineer for 5400 South and 7000 South interchanges is Bryan Chamberlain, telephone number (801) 887-3405, and e-mail bchamberlain@utah.gov, or their designated representative, as assigned.

UDOT's Resident Engineer for 9000 South and 11400 South interchanges is Ken Talbot, telephone number (801) 360-8750, and e-mail kentalbot@utah.gov, or their designated representative, as assigned.

Company's contact person for the Project is Daren Keller, telephone number (801) 356-6975, e-mail darren.keller@centurylink.com, and mailing address 75 East 100 North, Provo, Utah 84601.

After awarding the Project, UDOT will provide the Company with the Design Builder contact information, hereinafter referred to as "Design-Builder Project Representative."

3. AUTHORIZATION FOR DESIGN WORK

In order to facilitate coordination and obtain technical information about the Company's Utilities and requirements for inclusion in this Agreement and the Request for Proposals, UDOT gave the Company authorization for preliminary design engineering on April 26, 2016.

4. PROJECT REQUIREMENTS

The Company desires to design and construct its own Utility Work necessitated by the Project and shall conduct the Utility Work in accordance with the specific terms of the Statewide Utility Relocation Agreement.

The Company shall not commence performing any Utility Work until the Project Agreement is executed by both Parties and the Company receives an Authorization to Proceed letter.

****

IN WITNESS WHEREOF, the parties hereto have caused these presents to be executed by their duly authorized officers as of the day and year first written above.

MASTER UTILITY AGREEMENT

THIS MASTER UTILITY AGREEMENT, made and entered into this 8 day of Aug, 2016, by and between the **Utah Department of Transportation**, ("UDOT") and **Comcast Cable**, doing business as Comcast Cable, a Registered Corporation in the State of Utah, ("Company") (each as "Party" and jointly as "Parties").

RECITALS

WHEREAS, UDOT is preparing to request proposals for and award a design-build contract for the highway project identified as Project Number S-0154(12)11, 4 Interchanges on Bangerter Highway in Salt Lake County, Utah, ("Project"); and

WHEREAS, the design-build contractor will complete the design and administer construction of the Project ("Design-Builder"); and

WHEREAS, UDOT has identified Company facilities within the limits of the Project, which may necessitate the relocation, protection or adjustment of the facilities ("Utility Work"); and

WHEREAS, the Company desires to design and construct its own Utility Work necessitated by the Project; and

WHEREAS, for the purpose of expediting any required Utility Work and reimbursement, the Parties are entering into this Project Master Utility Agreement with the understanding that future supplemental agreements to this Agreement will be entered into covering Utility Work to be accomplished by the Company at specific Project locations.

THIS AGREEMENT is made to set out the terms and conditions where under the Utility Work shall be performed.

AGREEMENT

NOW THEREFORE, the Parties agree as follows:

1. CONTACT INFORMATION

UDOT's Project Representative is Alana Spendlove, UDOT Project Utility and Railroad Leader, telephone number (801) 887-3462, and e-mail aspendlove@utah.gov.

UDOT's Resident Engineer for 5400 South and 7000 South interchanges is Bryan Chamberlain, telephone number (801) 887-3405, and e-mail bchamberlain@utah.gov, or their designated representative, as assigned.

UDOT's Resident Engineer for 9000 South and 11400 South interchanges is Ken Talbot, telephone number (801) 360-8750, and e-mail kentalbot@utah.gov, or their designated representative, as assigned.

UDOT's Field Representative contact person will be identified in subsequent supplemental agreements.

Company's contact person is David Mascarenas, telephone number (801) 831-6622, and e-mail david_mascarenas@cable.comcast.com.

After awarding the Project, UDOT will provide the Company with the Design-Builder contact information, hereinafter referred to as "Design-Builder Project Representative."

2. AUTHORIZATION FOR DESIGN WORK

In order to facilitate coordination and obtain technical information about the Company's facilities and requirements for inclusion in this Agreement and the request for proposals, UDOT gave the Company authorization for preliminary design engineering on April 26, 2016.

3. SUBSURFACE UTILITY ENGINEERING

UDOT has performed Subsurface Utility Engineering (SUE) within the limits of the Project. Additional SUE work to determine the precise location of underground facilities at specific, critical locations on the Project will be reviewed with the Company

4. PROJECT COORDINATION

During the development of the Project design, Company and UDOT, along with its Design-Builder, shall consult as necessary in an effort to determine if conflicts with the Company's facilities can be avoided. The Parties shall confer until a resolution is reached on each potential conflict.

If Utility Work for the Company's facilities is required to accommodate the Project, UDOT will be responsible to propose and provide a location for the facilities. UDOT will provide the Company with Project design plans as early as possible, and will schedule and meet with the

Company to review the design, construction, estimates of cost, and scheduling for the Company's Utility Work at specific locations on the Project to insure maximum lead time for advance order of materials and work force scheduling.

The Company shall advise UDOT's Project Representative of the approximate time required for completion of the Utility Work and shall diligently pursue its Utility Work so that completion can be accomplished according to the pre-determined time schedule negotiated by the Company and UDOT in the supplemental agreement issued hereto for a specific Project location. The Company shall immediately notify UDOT's Project Representative by, phone call or email, of its discovery of any occurrence or unforeseen circumstances that would prevent the Company from completing its Utility Work according to the time schedule provided. In addition, the Company shall describe the circumstances in writing within 24-hours of the discovery to UDOT's Project Representative.

5. COMPANY REQUIREMENTS

UDOT will comply with the following Company requirements:

a. Company requires advance notice of 72 hours for emergency splicing, 5 business days for normal splicing, and 2-4 weeks' notice for larger distribution lines.
b. Company's maintenance hours of operation are between 1:00 a.m. and 6:00 a.m. The Company does not allow disruption of its cable television services.

6. COMPANY TO DESIGN AND CONSTRUCT ITS UTILITY WORK

The Company, with its regular engineering and construction forces at its standard schedule of wages and working hours, or through qualified contractors with whom they have continuing contracts, shall perform the necessary design work in accordance with Company's standards regularly followed by the Company and not considered a betterment, cost estimating, field and office engineering, furnish all materials, and perform the Utility Work necessitated by the Project.

7. STANDARD SPECIFICATIONS AND REGULATIONS

The Company, while engaged in the preliminary design and Utility Work of its facilities, shall comply with UDOT's 2012 Standard Specifications for Road and Bridge Construction and Utah Administrative Code R930-7.

8. UNDERBUILT AND FACILITY REMOVAL REQUIREMENTS

The Company is responsible to remove all Company-owned underbuilt facilities from utility poles that will be relocated or removed due to the Project.

9. RIGHT-OF-WAY

Any easements or replacement right-of-way required in conjunction with the Utility Work of Company's facilities will be acquired by UDOT in accordance with the requirements of Utah Administrative Code R930-8-7.

10. MAINTENANCE OF TRAFFIC (MOT), TRAFFIC CONTROL, CLEAR/GRUB, AND SURVEYING

UDOT will provide MOT and traffic control for Utility Work at no cost to the Company. The Company is responsible to coordinate Utility Work schedules and traffic control needs with UDOT to facilitate the Project schedule and minimize impacts to the public. Except in the case of emergencies, Company's Utility Work on the Project will be scheduled in compliance with the requirements of the Limitation of Operations contained in UDOT's Design-Builder contract with respect to lane closures, peak hour work restrictions, holiday and special event limitations, etc.

UDOT will provide, at no cost to the Company, clearing and grubbing of the roadway as required by the Company and in accordance with UDOT's Standard Specifications.

Surveying and staking of roadway facilities as required by the Company will be provided by UDOT in accordance with UDOT's Standard Specifications. The cost of the surveying and staking will be at UDOT's expense and the Company will have no obligation for the cost of surveying. Any of UDOT's survey control stakes or bench markers which are removed or damaged by the Company shall be reestablished by UDOT at the Company's expense.

11. BETTERMENT WORK

If the Company desires to include betterment work in the Project at any specific location, UDOT may agree to the betterment work provided the difference in costs between the functionally equivalent required Utility Work and the Company's desired betterment work shall be at the sole cost of the Company, and the betterment work can reasonably be accommodated without delaying UDOT's Project. The betterment work will be addressed by a separate supplemental agreement between UDOT and the Company.

Once a Design-Builder has been selected by UDOT, any betterment work request will be negotiated directly with the Design-Builder. However, it is at UDOT's sole discretion to approve the betterment work.

12. SUPPLEMENTAL AGREEMENTS

UDOT and the Company shall enter into individual supplemental agreements to cover Utility Work at specific Project locations. Each supplemental agreement will include a description and location of the Utility Work to be performed, design drawings showing the original and proposed locations of the facilities, Utility Work schedules, cost estimates, participation shares for UDOT and the Company, any proposed betterment work, and any necessary right-of-way documents. The cost estimates will be based upon the prices of materials and labor current as of the date of the estimates. The estimates do not account for increases due to unknown and unforeseen hardships in accomplishing the Utility Work. A copy of the format of the proposed supplemental agreement is marked Exhibit "A" that is incorporated by reference.

The Company will require a 2 week review and approval period for any final supplemental agreement submitted to the Company by UDOT.

In the event there are changes in the scope of the Utility Work, extra Utility Work, or changes in the planned Utility Work covered by a supplemental agreement, a modification to the supplemental agreement signed by the Parties is required prior to the start of Utility Work on the changes or additions.

13. UDOT AUTHORIZATION TO PROCEED WITH UTILITY WORK

The Company shall not perform any Utility Work until the supplemental agreement for the Utility Work is signed by the Company and received by UDOT. UDOT will review and approve the supplemental agreement and will issue an authorization to proceed to the Company for each specific Utility Work location.

14. COMPANY TO NOTIFY UDOT AND THE DESIGN-BUILDER BEFORE BEGINNING COMPANY-PERFORMED UTILITY WORK

The Company will notify UDOT's Resident Engineer as well as the Design-Builder Project Representative at least 2 business days in advance of beginning any Utility Work covered by any supplemental agreements hereto. The Company will give subsequent notifications of when and where the Company will be performing Utility Work to UDOT's Field Representative and the Design-Builder Project Representative on a day-to-day basis. Such subsequent notifications can be informal. Failure on the part of the Company to give proper notification to UDOT's Field Representative and the Design-Builder Project Representative will be cited to the Company and that portion of the Company's Utility Work performed while not under the surveillance of the UDOT Field Representative may be deducted from the reimbursement at UDOT's discretion

15. DAILY RECORD KEEPING

UDOT's Field Representative will keep daily records of the Utility Work performed by the Company forces. Daily records will be kept on forms to be prepared by the Company or UDOT. The type of form to be used shall be preapproved by UDOT's Contracts, Compliance, and Certification Manager. The daily records shall be signed by UDOT's Field Representative, and the Company or its authorized representative. Copies of the Utility Work daily records shall be retained by the Parties.

16. REIMBURSEMENT FOR COMPANY'S UTILITY WORK

In accordance with Utah Code §72-6-116(3)(a)(ii), UDOT will reimburse the Company 50% of the cost of Utility Work to accommodate a state highway project and the Company shall pay the remainder of the cost. UDOT will reimburse the Company 100% of the cost of Utility Work for facilities located on a public utility easement or subdivision plat, on a Company-owned private easement, or fee property. The Company shall provide UDOT with a copy of the public utility easement, private easement or fee title. The Utility Work and reimbursement will be in conformance with the requirements of Utah Administrative Code R930-8.

The Company shall submit itemized bills covering its actual costs incurred for performing the Utility Work covered by supplemental agreements to UDOT's Contracts and Compliance Specialist:

UDOT Contracts and Compliance Specialist
4501 South 2700 West
Construction Office, Box 148220
Salt Lake City, Utah 84114-8220

Itemized bills shall bear the Project number, supplemental agreement number, supporting sheets, and a complete billing statement of all actual costs incurred, following the order of the items in the detailed estimates contained in the supplemental agreement and be submitted to UDOT within 60 days following completion of the Utility Work by the Company on the Project. Otherwise, previous payments to the Company may be considered final, except as agreed to between the Parties in advance.

UDOT will reimburse the Company within 60 days after receipt of the billings, but only for those items complying fully with the provisions of Utah Administrative Code R930-8. Failure on the part of the Company to submit the billings within 6 months of the completion of the Utility Work will result in UDOT's disallowance of reimbursement for that portion of Utility Work.

17. SALVAGE CREDIT

In accordance with 23 C.F.R. §645.117, all materials from the existing facilities, which are recovered in suitable condition for reuse by the Company and not reused on the Project, shall be credited to the cost of the Project at current stock prices. If the materials are not suitable for reuse, they shall be credited at such other prices as agreed upon between the Company and UDOT following inspection of the recovered material.

18. REDESIGN AND REWORK OF UTILITY WORK DUE TO PROJECT CHANGES

If the Company's design of Utility Work has been completed and accepted by UDOT and the Company is required to redesign the Utility Work or redesign and reconstruct the Utility Work as a result of UDOT changing the Project design, the cost of the redesign or redesign and increased cost for the reconstruction of Utility Work will be paid in full by UDOT. UDOT will make adjustments for any additional time that may be required for the Company to redesign or modify its plans or re-work Utility Work due to UDOT changing the design after acceptance of the design plans for the Utility Work.

19. COMPANY'S COSTS DIFFER BY MORE THAN 10%

If the Company's actual costs incurred for its force account work differs more than 10% plus or minus per line item from the amount contained in the supplemental agreements, the Company is required to submit a letter of explanation with its billings indicating how and why the difference in costs occurred.

20. AUDIT

UDOT and the Federal Highway Administration shall have the right to audit all cost records and accounts of the Company pertaining to the Project in accordance with the auditing procedure of the Federal Highway Administration and 23 C.F.R. §645, subpart A. Should this audit disclose that the Company has been underpaid, UDOT will reimburse the Company upon submission of

additional billing to cover the underpayment. The Company shall submit the additional billing within 60 days from the date of the notification of the underpayment. Should this audit disclose that the Company has been overpaid, the Company will reimburse UDOT in the amount of the overpayment within 60 days of notification of audit findings. For the purpose of audit the Company is required to keep and maintain its records of Utility Work covered herein for a minimum of 3 years after final payment is received by the Company from UDOT.

21. ACCESS AND MAINTENANCE

Access for maintenance and servicing of Company's facilities located on the right-of-way of the Project will be allowed only by permit issued by UDOT to the Company. The Company will obtain the permit and abide by conditions thereof for policing and other controls in conformance with Utah Administrative Code R930-7.

22. MISCELLANEOUS

a. Each Party agrees to undertake and perform all further acts that are reasonably necessary to carry out the intent and purpose of the Agreement at the request of the other Party.

b. This Agreement in no way creates any type of agency relationship, joint venture, or partnership between UDOT and Company.

c. The failure of either Party to insist upon strict compliance of any of the terms and conditions, or failure or delay by either Party to exercise any rights or remedies provided in this Agreement, or by law, will not release either Party from any obligations arising under this Agreement.

d. This Agreement shall be deemed to be made under and shall be governed by the laws of the State of Utah in all respects. Each person signing this Agreement warrants that the person has full legal capacity, power, and authority to execute this Agreement for and on behalf of the respective Party and to bind such Party. This Agreement may be executed in one or more counterparts, each of which shall be an original, with the same effect as if the signatures were made upon the same instrument. This Agreement may be delivered by facsimile or electronic mail.

FIRST DIGITAL TELECOM
MASTER UTILITY AGREEMENT

THIS MASTER UTILITY AGREEMENT, made and entered into this _____ day of_____, 20_____, by and between the **Utah Department of Transportation**, ("UDOT") and **First Digital Telecom**, , a Company in the State of Utah, ("Company") (each as "Party" and jointly as "Parties").

RECITALS

WHEREAS, UDOT is preparing to request proposals for and award a design-build contract for the highway project identified as Project Number S-0154(12)11, 4 Interchanges on Bangerter Highway in Salt Lake County, Utah, ("Project"); and

WHEREAS, UDOT's design-build contractor ("Design-Builder") will complete the design and administer construction of the Project; and

WHEREAS, UDOT has identified Company facilities within the limits of the Project which may necessitate the relocation, protection, or adjustment of the facilities, ("Utility Work"); and

WHEREAS, the Company desires for the Design-Builder to design and construct the Company's Utility Work except cable/pedestal procurement, pulling, and splicing necessitated by the Project; and

WHEREAS, the Company will perform the necessary review and approval for the design and construction of its Utility Work, provide cable/pedestal procurement, pulling, splicing, and construction inspection to accommodate the Project Utility Work; and

WHEREAS, for the purpose of expediting any required Utility Work and reimbursement the Parties are entering into this Project Master Utility Agreement with the understanding that future supplemental agreements to this Agreement will be entered into covering Utility Work to be accomplished by the Company and UDOT at specific Project locations.

THIS AGREEMENT is made to set out the terms and conditions where under the Utility Work shall be performed.

DRAFT

AGREEMENT

NOW THEREFORE, the Parties agree as follows:

1. **INFORMATION**

UDOT's Project Representative is Alana Spendlove, UDOT Project Utility and Railroad Leader, telephone number (801) 887-3462, and e-mail aspendlove@utah.gov.

UDOT's Resident Engineer for 5400 South and 7000 South interchanges is Bryan Chamberlain, telephone number (801) 887-3405, and e-mail bchamberlain@utah.gov, or their designated representative, as assigned.

UDOT's Resident Engineer for 9000 South and 11400 South interchanges is Ken Talbot, telephone number (801) 360-8750, and e-mail kentalbot@utah.gov, or their designated representative, as assigned.

UDOT's Field Representative contact person will be identified in subsequent supplemental agreements.

Company's contact person is Ryan Finch, telephone number (801) 636-5350, and e-mail rfinch@firstdigital.com.

After awarding the Project, UDOT will provide the Company with the Design-Builder contact information, hereinafter referred to as "Design-Builder Project Representative".

2. **AUTHORIZATION FOR DESIGN WORK**

In order to facilitate coordination and obtain technical information about the Company's facilities and requirements for inclusion in this Agreement and the request for proposals, UDOT gave the Company authorization for preliminary design engineering on April 26, 2016.

3. **SUBSURFACE UTILITY ENGINEERING**

UDOT has performed Subsurface Utility Engineering (SUE) within the limits of the Project. Additional SUE work to determine the precise location of underground facilities at specific, critical locations on the Project will be reviewed with the Company.

4. **PROJECT COORDINATION**

Company and UDOT agree to have the Design-Builder include in the Project, items of Utility Work for the Company's facilities.

During the development of the Project design, the Company and UDOT, along with its Design-Builder, shall consult as necessary in an effort to determine if conflicts with the Company's facilities can be avoided. If Utility Work is required, UDOT will be responsible to propose and provide a location for the facilities. UDOT will provide the Company with Project design plans as early as possible, and will schedule and meet with the Company to review the design, construction, estimates of cost, and scheduling for the Company's Utility Work at specific locations

DRAFT

on the Project to ensure maximum lead time for advance order of materials and work force scheduling.

The Company shall advise UDOT's Project Representative of the approximate time required for completion of the Utility Work and shall diligently pursue its Utility Work so that completion can be accomplished according to the pre-determined time schedule negotiated by the Company and UDOT in the supplemental agreement issued hereto for a specific Project location. The Company shall immediately notify UDOT's Project Representative by phone call or email, of its discovery of any occurrence or unforeseen circumstances that would prevent the Company from completing its Utility Work according to the time schedule provided. In addition, the Company shall describe the circumstances in writing within 24-hours of the discovery to UDOT's Project Representative.

5. COMPANY REQUIREMENTS

UDOT will comply with the following Company Utility Work requirements**:**

1. Company splicing hours are from 12:00 p.m. to 5:00 a.m.
2. Provide minimum 12 inch separation of conduit from power in joint trench.
3. Include #14 gauge tracer wires in all conduits.
4. The Company will require a 2 week review and approval period for proposed designs, estimate review, and internal approvals after design plans and estimates are delivered to the Company.

6. UDOT TO DESIGN AND CONSTRUCT A PORTION OF UTILITY WORK

UDOT shall perform the necessary design work, cost estimating, field and office engineering, furnish all materials except cables and pedestals, and perform the Utility Work except pulling and splicing, necessitated by the Project.

UDOT will design the Utility Work in accordance with Company's standards regularly followed by the Company in its own work and not considered a betterment. In the event of a conflict between UDOT and Company standards, the higher standard will be applied.

UDOT will secure permits required for Utility Work for Company's facilities.

UDOT will supply as-constructed plans for the Utility Work it performs, in PDF format**,** upon completion of any required Utility Work.

7. COMPANY TO PERORM INSPECTION AND CONSTRUCT A PORTION OF THE UTILITY WORK

The Company will perform inspection of the Utility Work for the Company's facilities that will be performed by UDOT. UDOT will accomplish the Utility Work on the Company's facilities in accordance with the plans and specifications approved by the Company. Changes or additions to the plans and specifications shall be approved by the Company and UDOT through a supplemental agreement.

DRAFT

The Company will provide all cables, pedestals, pulling, and splicing necessary to accommodate the Utility Work of its facilities on the Project. The Company requires 2 weeks' notice to schedule splicing and fiber pulls and will determine the splicing window based on the circuit.

8. STANDARD SPECIFICATIONS AND REGULATIONS

The Company, while engaged in the preliminary design and Utility Work of its facilities, shall comply with UDOT's 2012 Standard Specifications for Road and Bridge Construction and Utah Administrative Code R930-7.

9. UNDERBUILT AND FACILITY REMOVAL REQUIREMENTS

The Company is responsible to see to the removal of all Company-owned underbuilt facilities from utility poles that will be relocated or removed due to the Project.

10. RIGHT-OF-WAY

Any easements or replacement right-of-way required in conjunction with the Utility Work of Company's facilities will be acquired by UDOT in accordance with the requirements of Utah Administrative Code R930-8-7.

11. MAINTENANCE OF TRAFFIC (MOT), TRAFFIC CONTROL, CLEAR/GRUB, AND SURVEYING

UDOT will provide MOT and traffic control for Utility Work at no cost to the Company. The Company is responsible to coordinate Utility Work schedules and traffic control needs with UDOT to facilitate the Project schedule and minimize impacts to the public. Except in the case of emergencies, Company's Utility Work on the Project will be scheduled in compliance with the requirements of the Limitation of Operations contained in UDOT's Design-Builder contract with respect to lane closures, peak hour Utility Work restrictions, holiday and special event limitations, etc.

UDOT will provide, at no cost to the Company, clearing and grubbing for the Utility Work as required by the Company and in accordance with UDOT's Standard Specifications.

Surveying and staking of roadway facilities as required by the Company will be provided by UDOT in accordance with UDOT's Standard Specifications. The cost of the surveying and staking will be at UDOT's expense and the Company will have no obligation for the cost of surveying. Any of UDOT's survey control stakes or bench markers, which are removed or damaged by the Company, shall be reestablished by UDOT at Company's expense.

12. BETTERMENT WORK

If the Company desires to include betterment work in the Project at any specific location, UDOT may agree to the betterment work providing the difference in costs between the functionally equivalent required Utility Work and the Company's desired betterment work, that is not required by the Project, shall be at the sole cost of the Company and the betterment work can reasonably

DRAFT

be accommodated without delaying UDOT's Project. The betterment work will be addressed by a separate supplemental agreement between UDOT and the Company.

Once a Design-Builder has been selected by UDOT, any betterment work request will be negotiated directly with the Design-Builder. However, it is at UDOT's sole discretion to approve the betterment work.

13. SUPPLEMENTAL AGREEMENTS

UDOT and the Company shall enter into individual supplemental agreements to cover Utility Work at specific Project locations. Each supplemental agreement will include a description and location of the Utility Work to be performed, design drawings showing the original and proposed locations of the Company's facilities, Utility Work schedules, cost estimates from all Parties, participation shares for UDOT and the Company, any proposed betterment work, and any necessary right-of-way documents. The estimates do not account for increases due to unknown and unforeseen hardships in accomplishing the Utility Work. A copy of the format of the proposed supplemental agreement is marked Exhibit "A" that is incorporated by reference.

The Company will require a 2 week review and approval period for any final supplemental agreement submitted to the Company by UDOT.

In the event there are changes in the scope of the Utility Work, extra Utility Work, or changes in the planned Utility Work covered by a supplemental agreement, a modification to the supplemental agreement approved in writing by the Parties is required prior to the start of Utility Work on the changes or additions.

14. UDOT AUTHORIZATION TO PROCEED WITH UTILITY WORK

The Company shall not perform any Utility Work until the supplemental agreement for the Utility Work is signed by the Company and received by UDOT. UDOT will review and approve the supplemental agreement and will issue an authorization to proceed to the Company for each specific Utility Work location.

15. UDOT TO NOTIFY THE COMPANY BEFORE BEGINNING UTILITY WORK

UDOT will notify the Company at least 2 business days in advance of beginning any Utility Work covered by any supplemental agreements hereto, to allow the Company time to schedule an inspector to be present during the Utility Work. Subsequent notification of when and where Utility Work will be performed will be given on a day-to-day basis. Should UDOT fail to give advance notification and Utility Work is performed without the presence of a Company inspector, UDOT will, at no cost to the Company, facilitate inspection of the Utility Work including, if necessary, uncovering the Utility Work.

16. COMPANY TO NOTIFY UDOT AND THE DESIGN-BUILDER BEFORE BEGINNING UTILITY WORK

The Company will notify UDOT's Project Representative as well as the Design-Builder Project Representative at least 2 business days in advance of beginning any Utility Work covered by any supplemental agreements hereto. The Company will give subsequent notifications of when

DRAFT

and where the Company will be performing Utility Work to UDOT's Field Representative and the Design-Builder Project Representative on a day-to-day basis. Such subsequent notifications can be informal. Failure on the part of the Company to give proper notification to UDOT's Field Representative and the Design-Builder Project Representative will be cited to the Company and that portion of the Company's Utility Work performed while not under the surveillance of the UDOT Field Representative may be deducted from the reimbursement at UDOT's discretion for.

17. INSPECTION

The Company shall provide on-call engineering support by the Company's engineer or appropriate representative for design review, schedule coordination, or to correct or clarify issues during the Utility Work, and to perform the necessary inspection for the Company's Utility Work installed by UDOT.

a. The Company engineer and/or inspector shall work with and through UDOT's Project Representative and shall give no orders directly to UDOT's Design-Builder unless authorized in writing to do so. UDOT will accomplish the Utility Work covered herein on Company's facilities in accordance with the plans and specifications provided and/or approved by the Company, including changes or additions to the plans and specifications, which are approved by the Parties hereto.
b. The Company shall immediately notify UDOT's Project Representative and the Design-Builder Project Representative of any deficiencies in the Utility Work on the Company's facilities. The Company shall follow up with written detail to UDOT's Project Representative and the Design-Builder Project Representative of its findings within 24-hours of making its initial notification.
c. UDOT will respond to the Company's concerns within 24-hours of written notification.
d. The Company, through its inspection of the Utility Work, will provide UDOT's Project Representative with information covering any problems or concerns the Company may have with acceptance of the facilities upon completion of the Utility Work.
e. Any periodic plan and specification review or construction inspection performed by UDOT arising out of the performance of the Company's Utility Work does not relieve the Company of its duty in the performance of the Utility Work or to ensure compliance with acceptable standards.

18. DAILY RECORDKEEPING

The Company will keep daily records of the inspection and Utility Work performed by the Company forces. Daily records will be in duplicate on a form to be prepared by the Company or UDOT. The type of form to be used shall be preapproved by UDOT's Contracts, Compliance, and Certification Manager. The daily records shall be signed by UDOT's Field Representative and the Company or its authorized representatives.

19. REIMBURSEMENT FOR COMPANY'S UTILITY WORK

In accordance with Utah Code §72-6-116(3)(a)(ii), UDOT will reimburse the Company 50% of the cost of Utility Work of its facilities on state highways and the Company shall pay the remainder of the cost of the Utility Work. UDOT will reimburse the Company 100% of the cost of Utility Work of its facilities located on a public utility easement, on a Company-owned private

DRAFT

easement or fee property. The Company shall provide UDOT with a copy of the public utility easement or subdivision plat, private easement or fee title. The Utility Work and reimbursement for Company's facilities required by the Project will be in conformance with the requirements of Utah Administrative Code R930-8.

The Company shall submit itemized bills covering its actual costs incurred for performing the Utility Work covered by supplemental agreements to UDOT's Contracts and Compliance Specialist:

UDOT Contracts and Compliance Specialist
4501 South 2700 West
Construction Office, Box 148220
Salt Lake City, Utah 84114-8220

Itemized bills shall bear the Project and supplemental agreement numbers, supporting sheets, and a complete billing statement of all actual costs incurred, following the order of the items in the detailed estimates contained in the supplemental agreement, and be submitted to UDOT within 60 days following completion of the Utility Work by the Company on the Project. Otherwise, previous payments to the Company may be considered final, except as agreed to between the Parties in advance. UDOT will reimburse the Company within 60 days after receipt of the billings, but only for those items complying fully with the provisions of Utah Administrative Code R930-8. Failure on the part of the Company to submit final billings within 6 months of the completion of the Utility Work will result in UDOT's disallowance of that portion of Utility Work reimbursement.

If the Company owes a balance to UDOT, the Company will reimburse UDOT within 60 days after receipt of billing from UDOT.

20. SALVAGE CREDIT

In accordance with 23 C.F.R. §645.117 all materials from Company's existing facilities which are recovered by UDOT while performing the Utility Work and not reused on this Project shall become the property of the Design-Builder unless otherwise agreed to in advance by the Parties hereto.

In accordance with 23 C.F.R. §645.117, all materials from the existing facilities, which are recovered in suitable condition for reuse by the Company and not reused on the Project, shall be credited to the cost of the Project at current stock prices. If the materials are not suitable for reuse, they shall be credited at such other prices as agreed upon between the Company and UDOT following inspection of the recovered material.

21. PROJECT DESIGN CHANGES

If UDOT changes the Project design after the Company has completed its design review; or if the Company has completed its portion of the Utility Work of its facilities based on previously approved design plans; the cost of the second design review and/or Utility Work is to be paid in full by UDOT. UDOT will make adjustments for any additional time that may be required for the Company to perform Utility Work on its facilities when required.

DRAFT

22. **COMPANY'S COSTS DIFFER BY MORE THAN 10%**

If the Company's actual costs incurred for its force account work differs more than 10% plus or minus per line item from the amount contained in the supplemental agreements, the Company is required to submit a letter of explanation with its billings indicating how and why the difference in costs occurred.

23. **RIGHT TO AUDIT**

UDOT and FHWA shall have the right to audit all cost records and accounts of the Company pertaining to this Project in accordance with the auditing procedure of the Federal Highway Administration and 23 C.F.R. §645, subpart A. Should this audit disclose that the Company has been underpaid, UDOT will reimburse the Company within 60 days upon submission of additional billing to cover the underpayment. Should this audit disclose that the Company has been overpaid, the Company will reimburse UDOT within 60 days of notification of audit findings in the amount of the overpayment. For the purpose of audit the Company is required to keep and maintain its records of Utility Work covered herein for a minimum of 3 years after final payment is received by the Company from UDOT.

The Company shall have the right to review UDOT's cost documentation for the Utility Work performed on behalf of the Company.

24. **ACCEPTANCE**

UDOT will provide notification to the Company for acceptance of the Utility Work upon completion of the final inspection. Company will have 60 days to respond in writing to UDOT with any additional comments in regards to the Utility Work. In the event that UDOT does not receive a written response within 60 days, UDOT will designate the Utility Work accepted by the Company. Upon acceptance of the Utility Work, the Company will accept, own and maintain its facilities. To the extent it may lawfully do so, Company further agrees to relieve UDOT from any responsibility or liability that may result for its new facilities or the operation thereof.

25. **ACCESS & MAINTENANCE**

Access for maintenance and servicing of Company's facilities located on the Project right-of-way will be allowed only by permit issued by UDOT. Company will obtain the permit and abide by conditions thereof for policing and other controls in conformance with Utah Administrative Code R930-7.

26. **MISCELLANEOUS**

a. Each Party agrees to undertake and perform all further acts that are reasonably necessary to carry out the intent and purpose of this Agreement at the request of the other Party.

b. This Agreement in no way creates any type of agency relationship, joint venture, or partnership between UDOT and Company.

DRAFT

c. The failure of either Party to insist upon strict compliance of any of the terms and conditions, or failure or delay by either Party to exercise any rights or remedies provided in this Agreement, or by law, will not release either Party from any obligations arising under this Agreement.

d. This Agreement shall be deemed to be made under and shall be governed by the laws of the State of Utah in all respects. Each person signing this Agreement warrants that the person has full legal capacity, power, and authority to execute this Agreement for and on behalf of the respective Party and to bind such Party. This Agreement may be executed in one or more counterparts, each of which shall be an original, with the same effect as if the signatures were made upon the same instrument. This Agreement may be delivered by facsimile or electronic mail.

SUPPLEMENTAL AGREEMENT NO. ___

Supplement to UDOT Finance No. _____

THIS SUPPLEMENTAL AGREEMENT, made and entered into this _____ day of _____, 20____, **Utah Department of Transportation**, ("UDOT"), and **First Digital Telecom**, a Company in the State of Utah, ("Company") each as ("Party") and jointly as ("Parties").

The Parties hereto entered in to a Master Utility Agreement (MUA) dated _____, UDOT Finance No. _____. All the terms of the MUA remain in full force and effect unless otherwise specified herein.

The Parties agree as follows:

1. UDOT and Company will perform the following described Utility Work in accordance with the terms and conditions of the MUA:

   a. Description of Utility Work to be performed, including proposed location, described in Exhibit "A" that is incorporated by reference: (Plan Sheets Attached)

   b. The Company requirements as shown in the MUA – Company Requirements, are modified as follows:

   c. Anticipated duration of Utility Work as shown on Exhibit "B" that is incorporated by reference:

   d. Betterments included:

TOTAL ESTIMATED COST OF SUPPLEMENTAL AGREEMENT _____	**$0.00**
TOTAL ESTIMATED COST OF COMPANY PERFORMED UTILITY WORK	$0.00
TOTAL ESTIMATED COST OF UDOT PERFORMED UTILITY WORK	$0.00
COMBINED TOTAL ESTIMATED COST OF UTILITY WORK	**$0.00**
TOTAL ESTIMATED AMOUNT OF COMPANY PARTICIPATION @ 50%	$0.00
TOTAL ESTIMATED AMOUNT OF UDOT PARTICIPATION @ 50%	$0.00

2. UDOT will notify the Company's contact person, Ryan Finch, Telephone No. (801)636-5350, email rfinch@firstdigital.com at least 48 hours in advance of beginning the Utility Work covered herein, or in accordance with the specific terms of the MUA, as applicable.

KEARNS IMPROVEMENT DISTRICT
MASTER UTILITY AGREEMENT

THIS MASTER UTILITY AGREEMENT, made and entered into this _____day of_____, 20_____, by and between the **Utah Department of Transportation**, ("UDOT"), and **Kearns Improvement District**, a Local Improvement District of the State of Utah, ("District") each as ("Party") and jointly as ("Parties").

RECITALS

WHEREAS, UDOT is preparing to request proposals for and award a design-build contract for the highway project identified as Project Number S-0154(12)11, 4 Interchanges on Bangerter Highway in Salt Lake County, Utah, ("Project"); and

WHEREAS, the design-build contractor will complete the design and administer construction of the Project ("Design-Builder"); and

WHEREAS, UDOT has identified District facilities within the limits of the Project which may necessitate the relocation, protection, or adjustment of the facilities, ("Utility Work"); and

WHEREAS, the District desires for the Design-Builder to design and perform the Utility Work on the District's facilities necessitated by the Project; and

WHEREAS, the District will perform the necessary design review and inspection to accommodate the Project; and

WHEREAS, for the purpose of expediting any required Utility Work and reimbursement, the Parties are entering into this Project Master Utility Agreement with the understanding that future supplemental agreements to this Agreement will be entered into covering the Utility Work to be accomplished by UDOT at specific Project locations.

THIS AGREEMENT is made to set out the terms and conditions where under the Utility Work shall be performed.

DRAFT

AGREEMENT

NOW THEREFORE, the Parties agree as follows:

1. PROJECT RESPONSIBLE FOR COST

In accordance with Utah Code § 72-6-116(3)(a)(ii), UDOT is responsible for 100% of the cost of the Utility Work of District's facilities for those costs that comply with Utah Administrative Code R930-8.

2. CONTACT INFORMATION

UDOT's Project Representative is Alana Spendlove, UDOT Project Utility and Railroad Leader, telephone number (801) 887-3462, and e-mail aspendlove@utah.gov.

UDOT's Resident Engineer for 5400 South and 7000 South interchanges is Bryan Chamberlain, telephone number (801) 887-3405, and e-mail bchamberlain@utah.gov, or their designated representative, as assigned.

UDOT's Resident Engineer for 9000 South and 11400 South interchanges is Ken Talbot, telephone number (801) 360-8750, and e-mail kentalbot@utah.gov, or their designated representative, as assigned.

UDOT's Field Representative contact person will be identified in subsequent supplemental agreements.

District's contact person is Greg Anderson, telephone number (801) 912-0282, and e-mail ganderson@kearnsid.org.

After awarding the Project, UDOT will provide the District with the Design Builder contact information, hereinafter referred to as "Design-Builder Project Representative".

3. AUTHORIZATION FOR DESIGN WORK

In order to facilitate coordination and obtain technical information about the District's facilities and requirements for inclusion in this Agreement and the Request for Proposals, UDOT gave the District authorization for preliminary design engineering on April 26, 2016.

4. SUBSURFACE UTILITY ENGINEERING

UDOT has performed Subsurface Utility Engineering (SUE) within the limits of the Project. Additional SUE work to determine the precise location of underground facilities at specific, critical locations on the Project will be reviewed with the District.

DRAFT

5. PROJECT COORDINATION

The District requested that UDOT include items of Utility Work for relocating and adjusting District's facilities in the Project.

During the development of the Project design, the District and UDOT, along with its Design-Builder, shall consult as necessary in an effort to determine if conflicts with the District's facilities can be avoided. If Utility Work for the District's facilities is required by the Project, UDOT will be responsible to identify the conflicts and to design and construct the Utility Work of the District's facilities. The District will perform the necessary design reviews prior to the start of Utility Work. UDOT's Project Representative will be responsible for coordinating with other utility companies as it relates to District's facilities.

6. DISTRICT REQUIREMENTS

UDOT will comply with the following District Utility Work requirements**:**

a. Size and depth of District Utility crossings must be determined and recorded prior to any Project directional boring or excavation activities near the District's facilities.
b. A District representative must be present during potholing, crossing, or relocation activities of District facilities.
c. The District requires review of material and product specification submittals for District approval prior to installation.
d. All District water service interruptions require following activities:
    i. Coordinate with the District for notification procedures to its serviced customer(s) and for processes to minimize service interruptions.
    ii. The District must approve the extent of service interruptions before Utility Work begins.
e. Notification must be given to the District prior to performing any potholing, crossing, or Utility Work on the District facilities. Utility Work installed without notification to the District will require remedial efforts for District acceptance. See section 11 below.
f. UDOT will supply as-constructed plans, in AutoCadd format, upon completion of any required Utility Work including betterment work.

7. UDOT TO DESIGN AND CONSTRUCT DISTRICT'S UTILITY WORK

UDOT will schedule and meet with the District to review the design and scheduling of the Utility Work for the District's facilities at specific locations on the Project to ensure maximum lead time for advance order of materials and work force scheduling.

UDOT will design the Utility Work in accordance with District's standards regularly followed by the District in its own work and not considered a betterment. In the event of a conflict between UDOT and District standards, the higher standard will be applied.

b. The District's current standards and specifications, dated September 2016, can be found at the District web site http://kearnsid.org/engspecs.PDF that is incorporated by reference.
c. UDOT will secure permits required for Utility Work of District's facilities.

DRAFT

8. **RIGHT-OF-WAY**

Any easements or replacement right-of-way required in conjunction with the Utility Work of District's facilities will be acquired by UDOT in accordance with the requirements of Utah Administrative Code R930-8.

9. **BETTERMENT WORK**

If the District desires to include betterment work in the Project at any specific location UDOT may agree to the betterment providing the difference in costs between the functionally equivalent required Utility Work and the District's desired betterment work that is not required by the Project shall be at the sole cost of the District and the betterment work can be accommodated without delaying UDOT's Project. The betterment work will be addressed by separate supplemental agreement between UDOT and the District.

Once a Design-Builder has been selected by UDOT, any betterment work request will be negotiated directly with the Design-Builder. However, it is at UDOT's sole discretion to approve the betterment work.

10. **SUPPLEMENTAL AGREEMENTS**

UDOT and the District shall enter into supplemental agreements to cover Utility Work at specific Project locations. As part of the supplemental agreement, UDOT will provide design plans and Utility Work schedules for review and approval by the District prior to start of the Utility Work. A copy of the format of the proposed supplemental agreement is marked Exhibit "A" that is incorporated by reference.

The District will require a 2 week review and approval period for any final supplemental agreement submitted to the District by UDOT.

In the event there are changes in the scope of the Utility Work, extra Utility Work, or changes in the planned Utility Work covered by a supplemental agreement, a modification to the supplemental agreement approved in writing by the Parties is required prior to the start of Utility Work on the changes or additions.

11. **UDOT TO NOTIFY DISTRICT BEFORE BEGINNING UTILITY WORK**

UDOT will notify the District at least 2 business days in advance of beginning any Utility Work covered by any supplemental agreements hereto, to allow the District time to schedule an inspector to be present during the Utility Work. Subsequent notification of when and where Utility Work will be performed will be given on a day-to-day basis.

12. **DISTRICT TO NOTIFY UDOT**

District's personnel shall notify UDOT's Field Representative upon arriving and leaving the Project site for verification of inspecting Utility Work. District's personnel will comply with all applicable OSHA and Project safety requirements while within the Project limits.

DRAFT

13. **INSPECTION**

The District shall provide on-call engineering support by District's engineer or appropriate representative for design review, schedule coordination, or to correct or clarify issues during Utility Work, and to perform the necessary inspection on the District's facilities installed by UDOT.

a. The District's engineer and/or inspector shall work with and through UDOT's Project Representative and shall give no orders directly to UDOT's Design-Builder unless authorized in writing to do so. UDOT will accomplish the Utility Work covered herein on District's facilities in accordance with the plans and specifications provided and/or approved by the District, including changes or additions to the plans and specifications, which are approved by the Parties hereto.
b. The District shall immediately notify UDOT's Project Representative and the Design-Builder Project Representative of any deficiencies in the Utility Work on the District's facilities. The District shall follow up with written detail to UDOT's Project Representative and the Design-Builder Project Representative of its findings within 24-hours of making its initial notification.
c. UDOT will respond to District's concerns within 24-hours of written notification.
d. The District, through its inspection of the Utility Work, will provide UDOT's Project Representative with information covering any problems or concerns the District may have with acceptance of the facilities upon completion of the Utility Work.
e. Any periodic plan and specification review or construction inspection performed by UDOT arising out of the performance of the Utility Work does not relieve the District of its duty in the performance of the Utility Work or to ensure compliance with acceptable standards.

14. **DAILY RECORDKEEPING**

UDOT's Field Representative will keep daily records of the inspection performed by the District. Daily inspection records will be in duplicate on a form to be prepared by the District or UDOT. The type of form to be used shall be preapproved by UDOT's Contracts, Compliance and Certification Manager. The inspection records shall be signed by UDOT's Field Representative, and the District or its authorized representatives. Copies of the inspection records shall be retained by the parties to this Agreement.

15. **REIMBURSEMENT**

UDOT will not reimburse the District for costs incurred by District personnel for design review, observation, inspection, and operation of valves performed as part of their regularly assigned duties. Should it become necessary for the District to procure outside services to perform design review, observation, or inspection to accommodate UDOT's Utility Work and Project schedule, the District shall notify UDOT. Upon concurrence by UDOT, a supplemental agreement for the cost of the services will be executed at which time the District may procure outside services through appropriate solicitation.

DRAFT

16. **SUBMITTAL OF ITEMIZED BILLS**

The District shall submit itemized bills covering the actual costs incurred for outside services to perform design review, oversight, and inspection work covered by supplemental agreements to UDOT's Contracts and Compliance Specialist:

UDOT Contracts and Compliance Specialist
Utah Department of Transportation
PO Box 141510
SLC, UT 84114-1510

Itemized bills shall bear the Project and supplemental agreement numbers, supporting sheets, and a complete billing statement of all actual costs incurred, following the order of the items in the detailed estimates contained in the supplemental agreement and be submitted to UDOT within 60 days following completion of outside services by the District on the Project. Otherwise, previous payments to the District may be considered final, except as agreed to between the Parties in advance.

UDOT will reimburse the District within 60 days after receipt of the billings, but only for items complying fully with the provisions of Utah Administrative Code R930-8. Failure on the part of the District to submit final billings within 6 months of the completion of outside services will result in UDOT's disallowance of that portion of outside services performed by the District.

17. **SALVAGED MATERIALS**

All materials from District's existing facilities which are recovered by UDOT while performing the Utility Work and not reused on this Project shall become the property of the Design-Builder unless otherwise agreed to in advance by the Parties hereto.

18. **RIGHT TO AUDIT**

UDOT and the Federal Highway Administration shall have the right to audit all cost records and accounts of the District pertaining to this Project in accordance with the auditing procedure of the Federal Highway Administration and 23 C.F.R. § 645, subpart A. Should this audit disclose that the District has been underpaid, the District will be reimbursed by UDOT within 60 days upon submission of additional billing to cover the underpayment. Should this audit disclose that the District has been overpaid, the District will reimburse UDOT within 60 days of notification of audit findings in the amount of the overpayment. For purpose of audit the District is required to keep and maintain its records of outsides services covered herein for a minimum of 3 years after final payment is received by the District from UDOT.

19. **ACCEPTANCE AND MAINTENANCE**

Upon completion of the Utility Work of District facilities by UDOT, the District will accept, own, and maintain its own facilities. The District shall be the sole owner of the facilities upon completion of the Project unless otherwise agreed to by the Parties. To the extent it may lawfully do so, District further agrees to relieve UDOT from any responsibility or liability that may result from its new facilities or the operation thereof.

DRAFT

20. **ACCESS**

It is understood that access for maintenance and servicing of District's facilities located on the right-of-way of the Project will be allowed only by permit issued by UDOT to the District, and that the District will obtain the permit and abide by conditions thereof for policing and other controls in conformance with Utah Administrative Code R930-7.

21. **INDEMNIFICATION**

UDOT and the District are both governmental entities subject to the Governmental Immunity Act. Each Party agrees to indemnify, defend, and save harmless the other from and against all claims, suits and costs, including attorneys' fees for injury or damage of any kind, arising out of its negligent acts, errors or omissions of its officers, agents, contractors or employees in the performance of this Agreement, and from and against all claims, suits, and costs, including attorneys' fees for injury or damage of any kind. Nothing in this paragraph is intended to create additional rights to third parties or to waive any of the provisions of the Governmental Immunity Act. The obligation to indemnify is limited to the dollar amounts set forth in the Governmental Immunity Act, provided the Act applies to the action or omission giving rise to the protections in this paragraph. The indemnification in this paragraph shall survive the expiration or termination of this Agreement.

22. **MISCELLANEOUS**

a. Each Party agrees to undertake and perform all further acts that are reasonably necessary to carry out the intent and purpose of this Agreement at the request of the other Party.

b. This Agreement in no way creates any type of agency relationship, joint venture, or partnership between UDOT and District.

c. The failure of either Party to insist upon strict compliance of any of the terms and conditions, or failure or delay by either Party to exercise any rights or remedies provided in this Agreement, or by law, will not release either Party from any obligations arising under this Agreement.

d. This Agreement shall be deemed to be made under and shall be governed by the laws of the State of Utah in all respects. Each person signing this Agreement warrants that the person has full legal capacity, power and authority to execute this Agreement for and on behalf of the respective Party and to bind such Party. This Agreement may be executed in one or more counterparts, each of which shall be an original, with the same effect as if the signatures were made upon the same instrument. This Agreement may be delivered by facsimile or electronic mail.

KEARNS IMPROVEMENT DISTRICT
SUPPLEMENTAL AGREEMENT NO. ___

Supplement to UDOT Finance No. _____

THIS SUPPLEMENTAL AGREEMENT, made and entered into this _____ day of _____, 20____, **Utah Department of Transportation**, ("UDOT"), and **Kearns Improvement District**, a Local Improvement District of the State of Utah, ("District") each as ("Party") and jointly as ("Parties").

The parties hereto entered in to a Master Utility Agreement (MUA) dated _____, UDOT Finance No. _____. All the terms of the Master Utility Agreement remain in full force and effect unless otherwise specified herein.

The Parties agree as follows:

1. UDOT will perform the following described Utility Work in accordance with the terms and conditions of the MUA:

   a. Description of Utility Work to be performed, including proposed location, described in Exhibit "A" that is incorporated by reference: (Plan Sheets Attached)
   b. The District requirements as shown in the MUA – District Requirements, are modified as follows:
      i.
   c. Anticipated duration of Utility Work:
   d. Total estimated cost of District's (100% reimbursable) outside services: (Detailed Estimate Attached)

2. UDOT will notify the District's Project Representative, Greg Anderson, telephone number (801) 912-0282, and e-mail ganderson@kearnsid.org at least 48 hours in advance of beginning the Utility Work covered herein, or in accordance with the specific terms of the MUA, as applicable.

MANUAL BROS., INC.
MASTER UTILITY AGREEMENT

THIS MASTER UTILITY AGREEMENT, made and entered into this _____ day of_____, 20_____, by and between the **Utah Department of Transportation**, ("UDOT") and **Manual Bros., Inc.**, a Company in Delaware, ("Company") (each as "Party" and jointly as "Parties").

RECITALS

WHEREAS, UDOT is preparing to request proposals for and award a design-build contract for the highway project identified as Project Number S-0154(12)11, 4 Interchanges on Bangerter Highway in Salt Lake County, Utah, ("Project"); and

WHEREAS, UDOT's design-build contractor ("Design-Builder") will complete the design and administer construction of the Project; and

WHEREAS, UDOT has identified Company facilities within the limits of the Project which may necessitate the relocation, protection, or adjustment of the facilities, ("Utility Work"); and

WHEREAS, the Company desires for the Design-Builder to design and construct the Company's Utility Work necessitated by the Project; and

WHEREAS, the Company will perform the necessary review and approval for the design and construction of its Utility Work to accommodate the Project; and

WHEREAS, for the purpose of expediting any required Utility Work and reimbursement the Parties are entering into this Project Master Utility Agreement with the understanding that future supplemental agreements to this Agreement will be entered into covering Utility Work to be accomplished by the Company and UDOT at specific Project locations.

THIS AGREEMENT is made to set out the terms and conditions where under the Utility Work shall be performed.

DRAFT

AGREEMENT

NOW THEREFORE, the Parties agree as follows:

1. CONTACT INFORMATION

UDOT's Project Representative is Alana Spendlove, UDOT Project Utility and Railroad Leader, telephone number (801) 887-3462 and e-mail aspendlove@utah.gov.

UDOT's Resident Engineer for 5400 South and 7000 South interchanges is Bryan Chamberlain, telephone number (801) 887-3405, and e-mail bchamberlain@utah.gov, or their designated representative, as assigned.

UDOT's Resident Engineer for 9000 South and 11400 South interchanges is Ken Talbot, telephone number (801) 360-8750, and e-mail kentalbot@utah.gov, or their designated representative, as assigned.

UDOT's Field Representative contact person will be identified in subsequent supplemental agreements.

Company's contact person is Tony Cole, telephone number (303) 459-8368, and e-mail tcole@quantappower.net.

After awarding the Project, UDOT will provide the Company with the Design-Builder contact information, hereinafter referred to as "Design-Builder Project Representative".

2. AUTHORIZATION FOR DESIGN WORK

In order to facilitate coordination and obtain technical information about the Company's facilities and requirements for inclusion in this Agreement and the request for proposals, UDOT gave the Company authorization for preliminary design engineering on April 26, 2016.

3. SUBSURFACE UTILITY ENGINEERING

UDOT has performed Subsurface Utility Engineering (SUE) within the limits of the Project. Additional SUE work to determine the precise location of underground facilities at specific, critical locations on the Project will be reviewed with the Company.

4. PROJECT COORDINATION

Company and UDOT agree to have the Design-Builder include in the Project, items of Utility Work for the Company's facilities.

During the development of the Project design, the Company and UDOT, along with its Design-Builder, shall consult as necessary in an effort to determine if conflicts with the Company's facilities can be avoided. If Utility Work is required, UDOT will be responsible to propose and provide a location for the facilities. UDOT will provide the Company with Project design plans as early as possible, and will schedule and meet with the Company to review the design, construction, estimates of cost, and scheduling for the Company's Utility Work at specific locations

DRAFT

on the Project to ensure maximum lead time for advance order of materials and work force scheduling.

The Company shall advise UDOT's Project Representative of the approximate time required for completion of the Utility Work and shall diligently pursue its Utility Work so that completion can be accomplished according to the pre-determined time schedule negotiated by the Company and UDOT in the supplemental agreement issued hereto for a specific Project location. The Company shall immediately notify UDOT's Project Representative by phone call or email, of its discovery of any occurrence or unforeseen circumstances that would prevent the Company from completing its Utility Work according to the time schedule provided. In addition, the Company shall describe the circumstances in writing within 24-hours of the discovery to UDOT's Project Representative.

5. COMPANY REQUIREMENTS

UDOT will comply with the following Company Utility Work requirements:

a. Comply with design, material, and construction standards shown in Exhibit "A", that is incorporated by reference.
b. Notify Company a minimum of 21 days in advance of all Utility Work.
c. Entire new duct bank structure must be installed and fiber optic cable installed/spliced BEFORE any part of existing duct bank structure is removed.
d. Color coding must be replicated in the new structure using Duct Configuration shown in Exhibit "B", that is incorporated by reference.
e. The Company will require a 2 week review and approval period for proposed designs, estimate review, and internal approvals after design plans and estimates are delivered to the Company.

6. UDOT TO DESIGN AND CONSTRUCT UTILITY WORK

UDOT shall perform the necessary design work, cost estimating, field and office engineering, furnish all materials and perform the Utility Work necessitated by the Project.

UDOT will design the Utility Work in accordance with Company's standards regularly followed by the Company in its own work and not considered a betterment. In the event of a conflict between UDOT and Company standards, the higher standard will be applied.

UDOT will secure permits required for Utility Work for Company's facilities.

UDOT will supply as-constructed plans for the Utility Work it performs, in AutoCad format**,** upon completion of any required Utility Work. See Company standards shown in Exhibit "A" for as-constructed requirements.

7. COMPANY TO PERORM INSPECTION OF THE UTILITY WORK

The Company will perform inspection of the Utility Work for the Company's facilities that will be performed by UDOT. UDOT will accomplish the Utility Work on the Company's facilities in accordance with the plans and specifications approved by the Company. Changes or additions to

DRAFT

the plans and specifications shall be approved by the Company and UDOT through a supplemental agreement.

8. STANDARD SPECIFICATIONS AND REGULATIONS

The Company, while engaged in the preliminary design and Utility Work of its facilities, shall comply with UDOT's 2012 Standard Specifications for Road and Bridge Construction and Utah Administrative Code R930-7. Company specification are listed as Exhibit "A". In the event of a conflict between UDOT and Company standards, the more stringent standard will be applied.

9. RIGHT-OF-WAY

Any easements or replacement right-of-way required in conjunction with the Utility Work of Company's facilities will be acquired by UDOT in accordance with the requirements of Utah Administrative Code R930-8-7.

10. MAINTENANCE OF TRAFFIC (MOT), TRAFFIC CONTROL, CLEAR/GRUB, AND SURVEYING

UDOT will provide MOT and traffic control for Utility Work at no cost to the Company. Except in the case of emergencies, the Utility Work on the Project will be scheduled in compliance with the requirements of the Limitation of Operations contained in UDOT's Design-Builder contract with respect to lane closures, peak hour Utility Work restrictions, holiday and special event limitations, etc.

UDOT will provide, at no cost to the Company, clearing and grubbing for the Utility Work as required by the Company and in accordance with UDOT's Standard Specifications.

Surveying and staking of roadway facilities as required by the Company will be provided by UDOT in accordance with UDOT's Standard Specifications. The cost of the surveying and staking will be at UDOT's expense and the Company will have no obligation for the cost of surveying. Any of UDOT's survey control stakes or bench markers, which are removed or damaged by the Company, shall be reestablished by UDOT at Company's expense.

11. BETTERMENT WORK

If the Company desires to include betterment work in the Project at any specific location, UDOT may agree to the betterment work providing the difference in costs between the functionally equivalent required Utility Work and the Company's desired betterment work, that is not required by the Project, shall be at the sole cost of the Company and the betterment work can reasonably be accommodated without delaying UDOT's Project. The betterment work will be addressed by a separate supplemental agreement between UDOT and the Company.

Once a Design-Builder has been selected by UDOT, any betterment work request will be negotiated directly with the Design-Builder. However, it is at UDOT's sole discretion to approve the betterment work.

DRAFT

12. SUPPLEMENTAL AGREEMENTS

UDOT and the Company shall enter into individual supplemental agreements to cover Utility Work at specific Project locations. Each supplemental agreement will include a description and location of the Utility Work to be performed, design drawings showing the original and proposed locations of the Company's facilities, Utility Work schedules, cost estimates from all Parties, participation shares for UDOT and the Company, any proposed betterment work, and any necessary right-of-way documents. The estimates do not account for increases due to unknown and unforeseen hardships in accomplishing the Utility Work. A copy of the format of the proposed supplemental agreement is marked Exhibit "C" that is incorporated by reference.

The Company will require a 2 week review and approval period for any final supplemental agreement submitted to the Company by UDOT.

In the event there are changes in the scope of the Utility Work, extra Utility Work, or changes in the planned Utility Work covered by a supplemental agreement, a modification to the supplemental agreement approved in writing by the Parties is required prior to the start of Utility Work on the changes or additions.

13. UDOT AUTHORIZATION TO PROCEED WITH UTILITY WORK

The Company shall not perform any Utility Work inspection until the supplemental agreement for the Utility Work is signed by the Company and received by UDOT. UDOT will review and approve the supplemental agreement and will issue an authorization to proceed to the Company for each specific Utility Work location.

14. UDOT TO NOTIFY THE COMPANY BEFORE BEGINNING UTILITY WORK

UDOT will notify the Company at least 14 business days in advance of beginning any Utility Work covered by any supplemental agreements hereto, to allow the Company time to schedule an inspector to be present during the Utility Work. Subsequent notification of when and where Utility Work will be performed will be given on a day-to-day basis. Should UDOT fail to give advance notification and Utility Work is performed without the presence of a Company inspector, UDOT will, at no cost to the Company, facilitate inspection of the Utility Work including, if necessary, uncovering the Utility Work.

15. COMPANY TO NOTIFY UDOT AND THE DESIGN-BUILDER BEFORE BEGINNING UTILITY WORK

The Company will notify UDOT's Resident Engineer as well as the Design-Builder Project Representative at least 2 business days in advance of beginning any Utility Work covered by any supplemental agreements hereto. The Company will give subsequent notifications of when and where the Company will be performing Utility Work to UDOT's Field Representative and the Design-Builder Project Representative on a day-to-day basis. Such subsequent notifications can be informal. Failure on the part of the Company to give proper notification to UDOT's Field Representative and the Design-Builder Project Representative will be cited to the Company and that portion of the Company's Utility Work performed while not under the surveillance of the UDOT Field Representative may be deducted from the reimbursement at UDOT's discretion for.

DRAFT

16. **INSPECTION**

The Company shall provide on-call engineering support by the Company's engineer or appropriate representative for design review, schedule coordination, or to correct or clarify issues during the Utility Work, and to perform the necessary inspection for the Company's Utility Work installed by UDOT.

a. The Company engineer and/or inspector shall work with and through UDOT's Project Representative and shall give no orders directly to UDOT's Design-Builder unless authorized in writing to do so. UDOT will accomplish the Utility Work covered herein on Company's facilities in accordance with the plans and specifications provided and/or approved by the Company, including changes or additions to the plans and specifications, which are approved by the Parties hereto.
b. The Company shall immediately notify UDOT's Project Representative and the Design-Builder Project Representative of any deficiencies in the Utility Work on the Company's facilities. The Company shall follow up with written detail to UDOT's Project Representative and the Design-Builder Project Representative of its findings within 24-hours of making its initial notification.
c. UDOT will respond to the Company's concerns within 24-hours of written notification.
d. The Company, through its inspection of the Utility Work, will provide UDOT's Project Representative with information covering any problems or concerns the Company may have with acceptance of the facilities upon completion of the Utility Work.
e. Any periodic plan and specification review or construction inspection performed by UDOT arising out of the performance of the Company's Utility Work does not relieve the Company of its duty in the performance of the Utility Work or to ensure compliance with acceptable standards.

17. **DAILY RECORDKEEPING**

The Company and UDOT will keep daily records of the inspection and Utility Work performed by the onsite forces. Daily records will be in duplicate on a form to be prepared by the Company and UDOT. The type of form to be used shall be preapproved by UDOT's Contracts, Compliance, and Certification Manager. The daily records shall be signed by UDOT's Field Representative and the Company or its authorized representatives.

18. **REIMBURSEMENT FOR COMPANY'S UTILITY WORK**

In accordance with Utah Code §72-6-116(3)(a)(ii), UDOT will reimburse the Company 50% of the cost of Utility Work of its facilities on state highways and the Company shall pay the remainder of the cost of the Utility Work. UDOT will reimburse the Company 100% of the cost of Utility Work of its facilities located on a public utility easement, on a Company-owned private easement or fee property. The Company shall provide UDOT with a copy of the public utility easement or subdivision plat, private easement or fee title. The Utility Work and reimbursement for Company's facilities required by the Project will be in conformance with the requirements of Utah Administrative Code R930-8.

The Company shall submit itemized bills covering its actual costs incurred for performing the Utility Work covered by supplemental agreements to UDOT's Contracts and Compliance Specialist:

DRAFT

UDOT Contracts and Compliance Specialist
4501 South 2700 West
Construction Office, Box 148220
Salt Lake City, Utah 84114-8220

Itemized bills shall bear the Project and supplemental agreement numbers, supporting sheets, and a complete billing statement of all actual costs incurred, following the order of the items in the detailed estimates contained in the supplemental agreement, and be submitted to UDOT within 60 days following completion of the Utility Work by the Company on the Project. Otherwise, previous payments to the Company may be considered final, except as agreed to between the Parties in advance. UDOT will reimburse the Company within 60 days after receipt of the billings, but only for those items complying fully with the provisions of Utah Administrative Code R930-8. Failure on the part of the Company to submit final billings within 6 months of the completion of the Utility Work will result in UDOT's disallowance of that portion of Utility Work reimbursement.

If the Company owes a balance to UDOT, the Company will reimburse UDOT within 60 days after receipt of billing from UDOT.

19. SALVAGE CREDIT

In accordance with 23 C.F.R. §645.117 all materials from Company's existing facilities which are recovered by UDOT while performing the Utility Work and not reused on this Project shall become the property of the Design-Builder unless otherwise agreed to in advance by the Parties hereto.

In accordance with 23 C.F.R. §645.117, all materials from the existing facilities, which are recovered in suitable condition for reuse by the Company and not reused on the Project, shall be credited to the cost of the Project at current stock prices. If the materials are not suitable for reuse, they shall be credited at such other prices as agreed upon between the Company and UDOT following inspection of the recovered material.

20. PROJECT DESIGN CHANGES

If UDOT changes the Project design after the Company has completed its design review; or if the Company has completed its portion of the Utility Work of its facilities based on previously approved design plans; the cost of the second design review and/or Utility Work is to be paid in full by UDOT. UDOT will make adjustments for any additional time that may be required for the Company to perform Utility Work on its facilities when required.

21. COMPANY'S COSTS DIFFER BY MORE THAN 10%

If the Company's actual costs incurred for its inspection differs more than 10% plus or minus per line item from the amount contained in the supplemental agreements, the Company is required to submit a letter of explanation with its billings indicating how and why the difference in costs occurred.

DRAFT

22. **RIGHT TO AUDIT**

UDOT and FHWA shall have the right to audit all cost records and accounts of the Company pertaining to this Project in accordance with the auditing procedure of the Federal Highway Administration and 23 C.F.R. §645, subpart A. Should this audit disclose that the Company has been underpaid, UDOT will reimburse the Company within 60 days upon submission of additional billing to cover the underpayment. Should this audit disclose that the Company has been overpaid, the Company will reimburse UDOT within 60 days of notification of audit findings in the amount of the overpayment. For the purpose of audit the Company is required to keep and maintain its records of Utility Work covered herein for a minimum of 3 years after final payment is received by the Company from UDOT.

The Company shall have the right to review UDOT's cost documentation for the Utility Work performed on behalf of the Company.

23. **ACCEPTANCE**

UDOT will provide notification to the Company for acceptance of the Utility Work upon completion of the final inspection. Company will have 60 days to respond in writing to UDOT with any additional comments in regards to the Utility Work. In the event that UDOT does not receive a written response within 60 days, UDOT will designate the Utility Work accepted by the Company. Upon acceptance of the Utility Work, the Company will accept, own and maintain its facilities. To the extent it may lawfully do so, Company further agrees to relieve UDOT from any responsibility or liability that may result for its new facilities or the operation thereof.

24. **ACCESS & MAINTENANCE**

Access for maintenance and servicing of Company's facilities located on the Project right-of-way will be allowed only by permit issued by UDOT. Company will obtain the permit and abide by conditions thereof for policing and other controls in conformance with Utah Administrative Code R930-7.

25. **MISCELLANEOUS**

a. Each Party agrees to undertake and perform all further acts that are reasonably necessary to carry out the intent and purpose of this Agreement at the request of the other Party.
b. This Agreement in no way creates any type of agency relationship, joint venture, or partnership between UDOT and Company.
c. The failure of either Party to insist upon strict compliance of any of the terms and conditions, or failure or delay by either Party to exercise any rights or remedies provided in this Agreement, or by law, will not release either Party from any obligations arising under this Agreement.
d. This Agreement shall be deemed to be made under and shall be governed by the laws of the State of Utah in all respects. Each person signing this Agreement warrants that the person has full legal capacity, power, and authority to execute this Agreement for and on behalf of the respective Party and to bind such Party. This Agreement may be executed in one or more counterparts, each of which shall be an original, with the

DRAFT

same effect as if the signatures were made upon the same instrument. This Agreement may be delivered by facsimile or electronic mail.

26. **ASSIGNMENT**

Company may assign this Agreement in whole, or in part, to a Permitted Assignee. As used herein, the term "Permitted Assignee" shall mean (a) any Affiliate of Company, (b) any Person that purchases all or substantially all of the assets of Company, or any other Person formed by or surviving the merger or consolidation of Company and any other person or (c) any institutional lender to whom this Agreement is assigned as collateral security for any indebtedness of Company or any Affiliate of Company, provided that such collateral assignment is subject to the terms of this Agreement. Upon any assignment to a Permitted Assignee, the assignor shall remain jointly and severally liable with the Permitted Assignee for the performance under this Agreement. Company may assign this agreement to any other assignee that is not a Permitted Assignee, provided that Company is not in default under this Agreement and that such other assignee shall expressly assume in writing all obligations and liabilities with respect to this Agreement, with the prior written consent of UDOT which consent shall not be unreasonably withheld.

DRAFT

STANDARDS

COMPANY DRAWINGS REQUIREMENTS:

UDOT will supply as-constructed plans for the Utility Work it performs for the Company Utility Work upon completion. In the event UDOT performs including any services which alter the route, including but not limited to line, depth of cover, adding or removing hand-holes markers or conduits, etc.,

In the event the re-route is greater than 1,000 feet, UDOT shall provide updates in both hard copy and electronic format (Auto-CAD Release 14.0 or 2000) within 30 days of completion of the change, i.e. completion of cable relocation project.

AS-CONSTRUCTED DRAWINGS MUST CONTAIN A MINIMUM OF THE FOLLOWING:

a) Drawing size of 11" by 17".

b) Table showing the list of drawings.

c) As-constructed Drawings showing the following:

- Conduit length summary
- Number of Terminals
- Number of POPs
- Number of Splice Manholes
- Number of Intermediate Manholes
- Number of Leased Manholes First Digital
- Number of Buried Splice Vaults
- Number of Buried Pull Vaults

d) Information showing the location of the running line, relative to permanent landmarks, including but not limited to, railroad mileposts, boundary crossings and utility crossings. All information shall be geographically accurate. The running line will be stationed horizontally.

e) Splice locations with amount of slack coil.

f) Manhole and hand-hole locations with any amount of slack coil noted.

g) Conduit information (type, length, expansion joints, etc.).

h) ROW detail (type, centerline distances, boundaries, waterways, and road crossings, known utilities and obstacles).

Drawings will be updated with actual field data during and after construction.

MATERIALS:

DRAFT

PVC conduit shall be a minimum of schedule 40 wall thickness, HDPE conduit shall be SDR-11. Follow Duct Configuration shown in Exhibit "B".

The use of steel pipe shall be avoided, whenever possible. If carbon steel pipe must be used, written approval of Company is required.

Hand-holes (vaults) and covers shall be constructed from polymer concrete with a vault load-bearing capacity as per ANSI/SCTE 77 2002 as shown in Table 1 below:

TABLE 1: ANSI/SCTE 77 2002 VAULT LOAD BEARING REQUIREMENTS			
APPLICATION	LOADING	REQUIREMENTS	
TIER 8: Sidewalk or off-roadway applications with a safety factor for non-deliberate vehicular traffic.	Vertical	Design Load	8000 pounds
		Test Load	12000 pounds
	Lateral	Design Load	600 pounds/sq. ft.
		Test Load	900 pounds/sq. ft.
TIER 15: Driveway, parking lot, and off-roadway applications subject to occasional non-deliberate heavy vehicular traffic.	Vertical	Design Load	15000 pounds
		Test Load	22500 pounds
	Lateral	Design Load	800 pounds/sq. ft.
		Test Load	1200 pounds/sq. ft.
AASHTO H-20: Deliberate vehicular traffic applications.	Certified pre-cast concrete, cast iron or AASHTO recognized materials		
Ratings are for vaults to be installed at grade level to 48 inches of cover. Installation at depth greater than 48 inches requires an increase in the vault rating.			

ATT
ATT
First Digital

Hand-hole lids shall be equipped with an EMS marker for electronic locating capability. If a hand-hole lid is not equipped with an EMS marker, an EMS ball must be buried 2 - 4 feet below ground directly over the hand-hole box.

ATT

MINIMUM DEPTH OF COVER:
(a) Minimum cover required in placement of conduit shall be 42 inches to top of conduit, except where field conditions dictate otherwise as referenced below.

(b) For conduit systems with manhole access, the depth of cover shall be a minimum 36 inches to top of conduit.

(c) At locations where conduit crosses other subsurface utilities or other structures, the conduit shall be installed to provide adequate vertical clearance (minimum of 12 inches) and the applicable minimum depth can be maintained; otherwise the conduit will be installed under the existing utility or other structure. If, however, adequate clearance cannot be obtained and the conduit must be placed above, the cable shall be encased in steel pipe and HDPE conduit.

(d) At road crossings, the conduit shall be placed at a minimum depth of 60" below the bottom of the ditch.

(e) In rock, the conduit depth shall be:
36 inches - 42 inches in HDPE,

DRAFT

24 inches - 36 inches in HDPE encased in steel,
18 inches - 24 inches in HDPE or PVC or steel and concrete encased.

(f) PVC and HDPE conduit will be back-filled with 6 inches of select materials (padding) in rock areas. MDl Polyurethane channel (Fiber-Rockgard by Chempro, Inc. or equivalent) may be used as protective cover in lieu of select material padding.

(g) Buried Hand-holes: 36 inches minimum depth to top of the hand-hole. The placement of hand-holes in cropland and pastures shall be avoided if at all possible, for access reasons. If this cannot be avoided, then the top of the hand-hole shall be placed at least 3 feet below the maximum depth attained by the agricultural equipment, due to hand-dig zone requirements.

BURIED CABLE WARNING TAPE:
All conduits will be installed with buried cable warning tape except where existing steel pipelines or existing conduit systems are used. Buried cable warning tape shall be 6 inches wide and display a written message similar to: “Warning: Buried Fiber Optic Cable," Manuel Bros. name and 800 number one call number repeated every 24 inches. The warning tape shall generally be placed at 12 to 24 inches below grade and directly above the conduit.

CONDUIT CONSTRUCTION:
Conduits may be placed by means of trenching, plowing, jack and bore, push-pull method, or directional bore. Conduits will generally be placed on a level grade parallel to the surface, with only gradual changes in grade elevation.

Conduit crossings of roads maintained by government bodies and railroad crossings will be encased in steel conduit, except where the cable is placed with 10 feet or more of cover. In the latter case, HDPE is adequate.

Conduit placed by the push-pull method (that is using a push rod, followed by pulling conduit) may use HDPE, PVC, or steel conduit.

All directional bores will use HDPE equivalent to Schedule 80 PVC or better or steel conduit.
In areas prone to lightning, HDPE is the preferred material.

All conduits placed on bridges shall have expansion joints placed at each structural (bridge) expansion joint or at least every 300 feet, whichever is the shorter distance. For bridges under 100 feet, at least one conduit expansion joint will be placed, even if there is no bridge expansion joint.

INNERDUCT INSTALLATION:
Innerduct(s) shall be installed in all steel conduits. No cable will be placed directly in any split/solid steel conduit without innerduct.
Innerduct(s) shall extend beyond the end of all conduits a minimum of eighteen (18) inches.

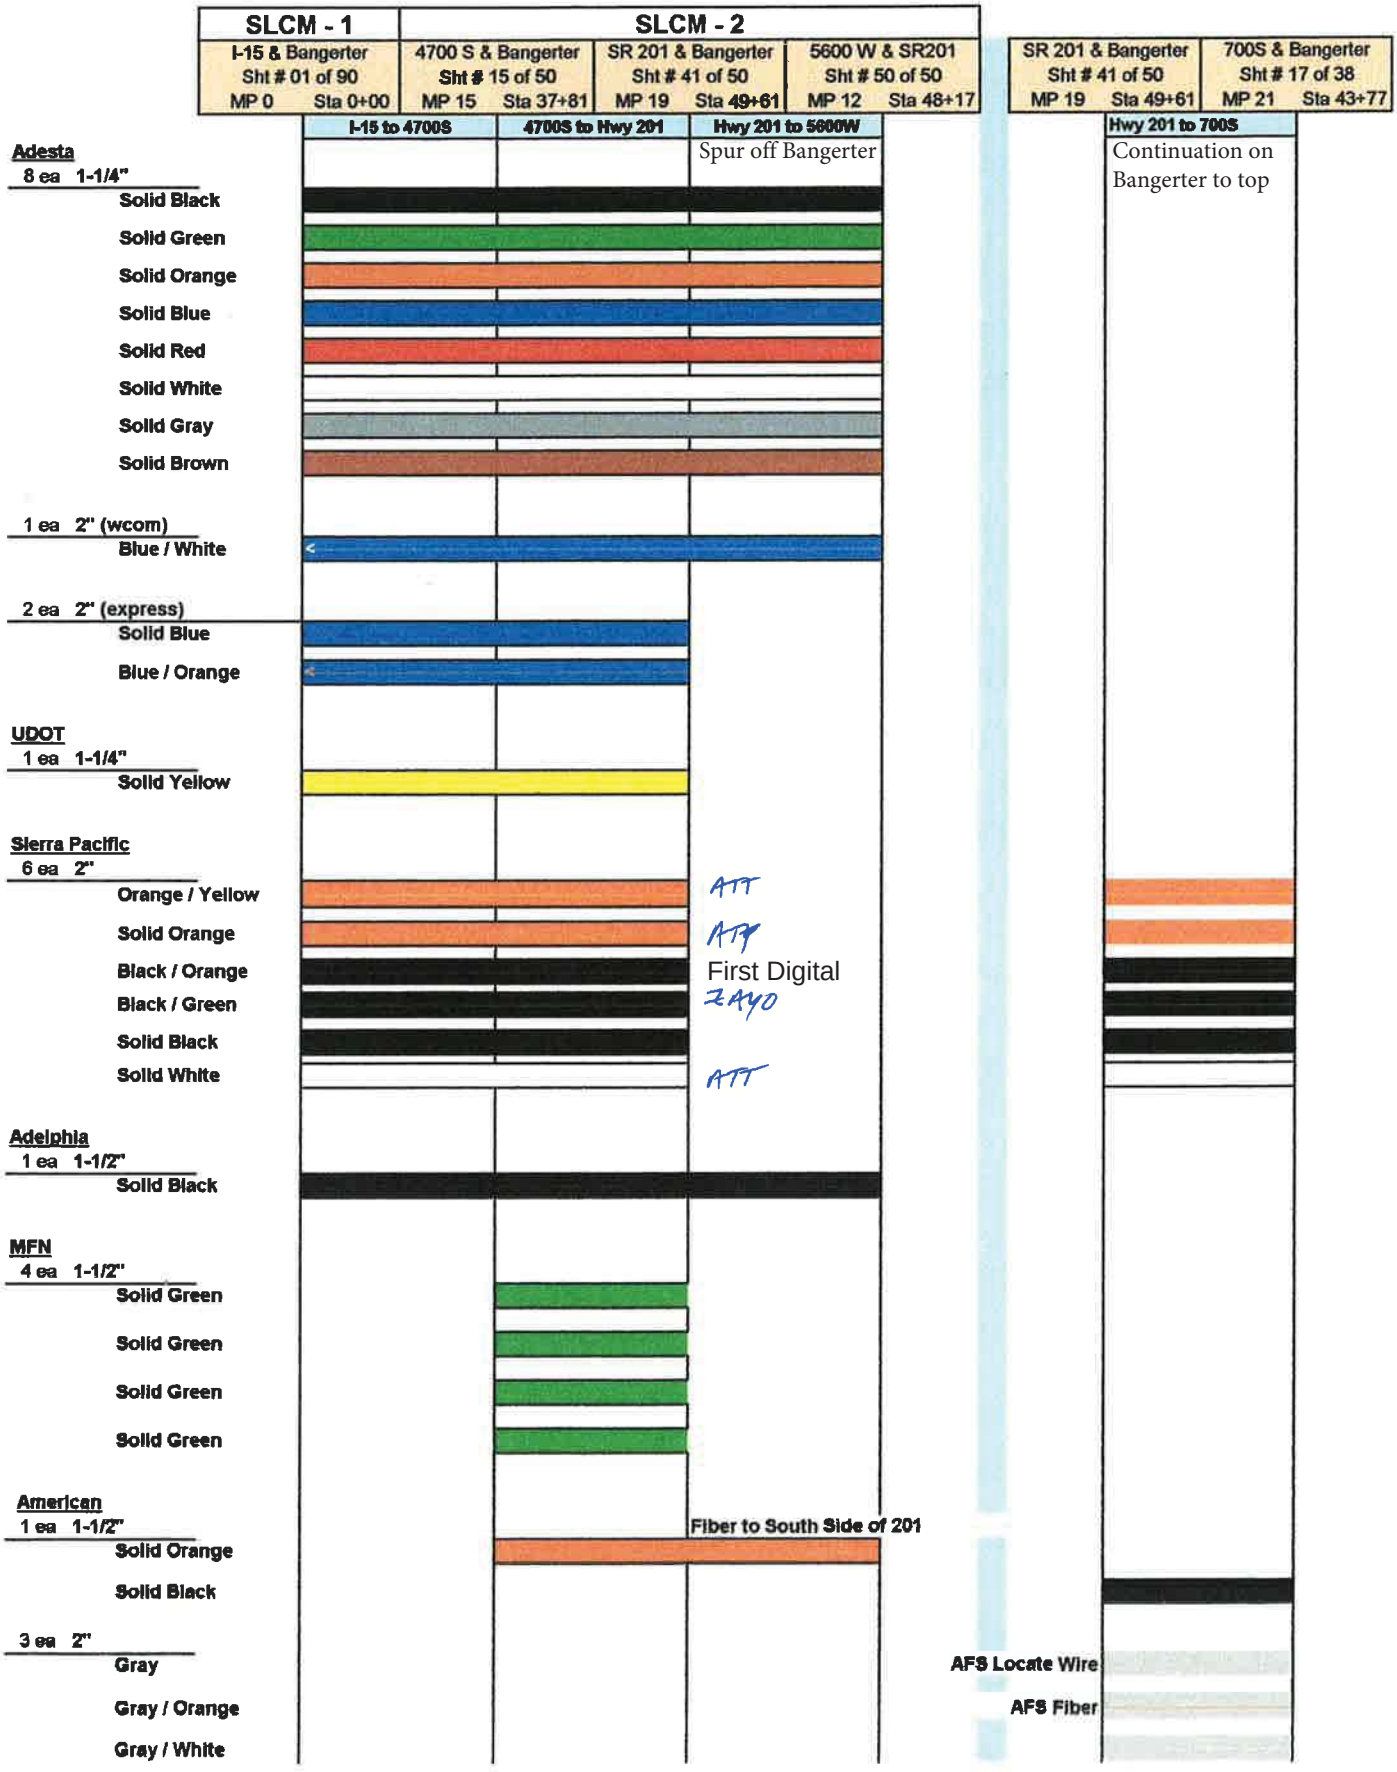
DUCT CONFIGURATION



MCI COMMUNICATION SERVICES
MASTER UTILITY AGREEMENT

THIS MASTER UTILITY AGREEMENT, made and entered into this _____ day of_____, 20_____, by and between the **Utah Department of Transportation**, ("UDOT") and **MCI Communication Services**, a Delaware Corporation, ("Company") (each as "Party" and jointly as "Parties").

RECITALS

WHEREAS, UDOT is preparing to request proposals for and award a design-build contract for the highway project identified as Project Number S-0154(12)11, 4 Interchanges on Bangerter Highway in Salt Lake County, Utah, ("Project"); and

WHEREAS, UDOT's design-build contractor ("Design-Builder") will complete the design and administer construction of the Project; and

WHEREAS, UDOT has identified Company facilities within the limits of the Project which may necessitate the relocation, protection, or adjustment of the facilities, ("Utility Work"); and

WHEREAS, the Company desires for the Design-Builder to design and construct the Company's Utility Work except cable and pedestal procurement, pulling, and splicing necessitated by the Project; and

WHEREAS, the Company will perform the necessary review and approval for the design, cable and pedestal procurement, pulling, and splicing, and construction inspection to accommodate the Project; and

WHEREAS, for the purpose of expediting any required Utility Work and reimbursement the Parties are entering into this Project Master Utility Agreement with the understanding that future supplemental agreements to this Agreement will be entered into covering Utility Work to be accomplished by the Company and UDOT at specific Project locations.

THIS AGREEMENT is made to set out the terms and conditions where under the Utility Work shall be performed.

DRAFT

AGREEMENT

NOW THEREFORE, the Parties agree as follows:

1. CONTACT INFORMATION

UDOT's Project Representative is Alana Spendlove, UDOT Project Utility and Railroad Leader, telephone number (801) 887-3462, and e-mail aspendlove@utah.gov.

UDOT's Resident Engineer for 5400 South and 7000 South interchanges is Bryan Chamberlain, telephone number (801) 887-3405, and e-mail bchamberlain@utah.gov, or their designated representative, as assigned.

UDOT's Resident Engineer for 9000 South and 11400 South interchanges is Ken Talbot, telephone number (801) 360-8750, and e-mail kentalbot@utah.gov, or their designated representative, as assigned.

UDOT's Field Representative contact person will be identified in subsequent supplemental agreements.

Company's contact person is David McAllister, telephone number (303) 214-7115, and e-mail david.mcallister@verizon.com.

After awarding the Project, UDOT will provide the Company with the Design-Builder contact information, hereinafter referred to as "Design-Builder Project Representative".

2. AUTHORIZATION FOR DESIGN WORK

In order to facilitate coordination and obtain technical information about the Company's facilities and requirements for inclusion in this Agreement and the request for proposals, UDOT gave the Company authorization for preliminary design engineering on April 26, 2016.

3. SUBSURFACE UTILITY ENGINEERING

UDOT has performed Subsurface Utility Engineering (SUE) within the limits of the Project. Additional SUE work to determine the precise location of underground facilities at specific, critical locations on the Project will be reviewed with the Company.

4. PROJECT COORDINATION

Company and UDOT agree to have the Design-Builder include in the Project, items of Utility Work for the Company's facilities.

During the development of the Project design, the Company and UDOT, along with its Design-Builder, shall consult as necessary in an effort to determine if conflicts with the Company's facilities can be avoided. If Utility Work is required, UDOT will be responsible to propose and provide a location for the facilities. UDOT will provide the Company with Project design plans as early as possible, and will schedule and meet with the Company to review the design, construction, estimates of cost, and scheduling for the Company's Utility Work at specific locations

DRAFT

on the Project to ensure maximum lead time for advance order of materials and work force scheduling.

The Company shall advise UDOT's Project Representative of the approximate time required for completion of the Utility Work and shall diligently pursue its Utility Work so that completion can be accomplished according to the pre-determined time schedule negotiated by the Company and UDOT in the supplemental agreement issued hereto for a specific Project location. The Company shall immediately notify UDOT's Project Representative by phone call or email, of its discovery of any occurrence or unforeseen circumstances that would prevent the Company from completing its Utility Work according to the time schedule provided. In addition, the Company shall describe the circumstances in writing within 24-hours of the discovery to UDOT's Project Representative.

5. COMPANY REQUIREMENTS

UDOT will comply with the following Company Utility Work requirements:

a. The Project and/or Utility Work shall not impact the operation of Company's facilities from November 15 through January 15 without prior written approval from Company. The Project schedule shall be developed accordingly.

6. UDOT TO DESIGN AND CONSTRUCT A PORTION OF UTILITY WORK

UDOT shall perform the necessary design work, cost estimating, field and office engineering, furnish all materials (except cable and pedestal) and perform the Utility Work (except pulling and splicing) necessitated by the Project.

UDOT will design the Utility Work in accordance with Company's standards regularly followed by the Company in its own work and not considered a betterment. In the event of a conflict between UDOT and Company standards, the higher standard will be applied.

UDOT will secure permits required for Utility Work for Company's facilities.

UDOT will supply as-constructed plans for the Utility Work it performs, in _____ format**,** upon completion of any required Utility Work.

7. COMPANY TO PERORM INSPECTION AND CONSTRUCT A PORTION OF THE UTILITY WORK

The Company will perform inspection of the Utility Work for the Company's facilities that will be performed by UDOT. UDOT will accomplish the Utility Work on the Company's facilities in accordance with the plans and specifications approved by the Company. Changes or additions to the plans and specifications shall be approved by the Company and UDOT through a supplemental agreement.

The Company will provide all cables, pedestals, pulling and splicing necessary to accommodate the Utility Work of its facilities on the Project. The Company requires 30 days' notice to schedule splicing and fiber pulls and will determine the splicing window based on the circuit.

DRAFT

8. STANDARD SPECIFICATIONS AND REGULATIONS

The Company, while engaged in the preliminary design and Utility Work of its facilities, shall comply with UDOT's 2012 Standard Specifications for Road and Bridge Construction and Utah Administrative Code R930-7.

9. UNDERBUILT AND FACILITY REMOVAL REQUIREMENTS

The Company is responsible to remove all Company-owned underbuilt facilities from utility poles that will be relocated or removed due to the Project.

10. RIGHT-OF-WAY

Any easements or replacement right-of-way required in conjunction with the Utility Work of Company's facilities will be acquired by UDOT in accordance with the requirements of Utah Administrative Code R930-8-7.

11. MAINTENANCE OF TRAFFIC (MOT), TRAFFIC CONTROL, CLEAR/GRUB, AND SURVEYING

UDOT will provide MOT and traffic control for Utility Work at no cost to the Company. The Company is responsible to coordinate Utility Work schedules and traffic control needs with UDOT to facilitate the Project schedule and minimize impacts to the public. Except in the case of emergencies, Company's Utility Work on the Project will be scheduled in compliance with the requirements of the Limitation of Operations contained in UDOT's Design-Builder contract with respect to lane closures, peak hour Utility Work restrictions, holiday and special event limitations, etc.

UDOT will provide, at no cost to the Company, clearing and grubbing for the Utility Work as required by the Company and in accordance with UDOT's Standard Specifications.

Surveying and staking of roadway facilities as required by the Company will be provided by UDOT in accordance with UDOT's Standard Specifications. The cost of the surveying and staking will be at UDOT's expense and the Company will have no obligation for the cost of surveying. Any of UDOT's survey control stakes or bench markers, which are removed or damaged by the Company, shall be reestablished by UDOT at Company's expense.

12. BETTERMENT WORK

If the Company desires to include betterment work in the Project at any specific location, UDOT may agree to the betterment work providing the difference in costs between the functionally equivalent required Utility Work and the Company's desired betterment work, that is not required by the Project, shall be at the sole cost of the Company and the betterment work can reasonably be accommodated without delaying UDOT's Project. The betterment work will be addressed by a separate supplemental agreement between UDOT and the Company.

Once a Design-Builder has been selected by UDOT, any betterment work request will be negotiated directly with the Design-Builder. However, it is at UDOT's sole discretion to approve the betterment work.

DRAFT

13. SUPPLEMENTAL AGREEMENTS

UDOT and the Company shall enter into individual supplemental agreements to cover Utility Work at specific Project locations. Each supplemental agreement will include a description and location of the Utility Work to be performed, design drawings showing the original and proposed locations of the Company's facilities, Utility Work schedules, cost estimates from all Parties, participation shares for UDOT and the Company, any proposed betterment work, and any necessary right-of-way documents. The estimates do not account for increases due to unknown and unforeseen hardships in accomplishing the Utility Work. A copy of the format of the proposed supplemental agreement is marked Exhibit "A" that is incorporated by reference.

The Company will require a 2 week review and approval period for any final supplemental agreement submitted to the Company by UDOT.

In the event there are changes in the scope of the Utility Work, extra Utility Work, or changes in the planned Utility Work covered by a supplemental agreement, a modification to the supplemental agreement approved in writing by the Parties is required prior to the start of Utility Work on the changes or additions.

14. UDOT AUTHORIZATION TO PROCEED WITH UTILITY WORK

The Company shall not perform any Utility Work until the supplemental agreement for the Utility Work is signed by the Company and received by UDOT. UDOT will review and approve the supplemental agreement and will issue an authorization to proceed to the Company for each specific Utility Work location.

15. UDOT TO NOTIFY THE COMPANY BEFORE BEGINNING UTILITY WORK

UDOT will notify the Company at least 2 business days in advance of beginning any Utility Work covered by any supplemental agreements hereto, to allow the Company time to schedule an inspector to be present during the Utility Work. Subsequent notification of when and where Utility Work will be performed will be given on a day-to-day basis. Should UDOT fail to give advance notification and Utility Work is performed without the presence of a Company inspector, UDOT will, at no cost to the Company, facilitate inspection of the Utility Work including, if necessary, uncovering the Utility Work.

16. COMPANY TO NOTIFY UDOT AND THE DESIGN-BUILDER BEFORE BEGINNING UTILITY WORK

The Company will notify UDOT's Project Representative as well as the Design-Builder Project Representative at least 2 business days in advance of beginning any Utility Work covered by any supplemental agreements hereto. The Company will give subsequent notifications of when and where the Company will be performing Utility Work to UDOT's Field Representative and the Design-Builder Project Representative on a day-to-day basis. Such subsequent notifications can be informal. Failure on the part of the Company to give proper notification to UDOT's Field Representative and the Design-Builder Project Representative will be cited to the Company and that portion of the Company's Utility Work performed while not under the surveillance of the UDOT Field Representative may be deducted from the reimbursement at UDOT's discretion for.

DRAFT

17. INSPECTION

The Company shall provide on-call engineering support by the Company's engineer or appropriate representative for design review, schedule coordination, or to correct or clarify issues during the Utility Work, and to perform the necessary inspection for the Company's Utility Work installed by UDOT.

a. The Company engineer and/or inspector shall work with and through UDOT's Project Representative and shall give no orders directly to UDOT's Design-Builder unless authorized in writing to do so. UDOT will accomplish the Utility Work covered herein on Company's facilities in accordance with the plans and specifications provided and/or approved by the Company, including changes or additions to the plans and specifications, which are approved by the Parties hereto.
b. The Company shall immediately notify UDOT's Project Representative and the Design-Builder Project Representative of any deficiencies in the Utility Work on the Company's facilities. The Company shall follow up with written detail to UDOT's Project Representative and the Design-Builder Project Representative of its findings within 24-hours of making its initial notification.
c. UDOT will respond to the Company's concerns within 24-hours of written notification.
d. The Company, through its inspection of the Utility Work, will provide UDOT's Project Representative with information covering any problems or concerns the Company may have with acceptance of the facilities upon completion of the Utility Work.
e. Any periodic plan and specification review or construction inspection performed by UDOT arising out of the performance of the Company's Utility Work does not relieve the Company of its duty in the performance of the Utility Work or to ensure compliance with acceptable standards.

18. DAILY RECORDKEEPING

The Company will keep daily records of the inspection and Utility Work performed by the Company forces. Daily records will be in duplicate on a form to be prepared by the Company or UDOT. The type of form to be used shall be preapproved by UDOT's Contracts, Compliance, and Certification Manager. The daily records shall be signed by UDOT's Field Representative and the Company or its authorized representatives.

19. REIMBURSEMENT FOR COMPANY'S UTILITY WORK

In accordance with Utah Code §72-6-116(3)(a)(ii), UDOT will reimburse the Company 50% of the cost of Utility Work of its facilities on state highways and the Company shall pay the remainder of the cost of the Utility Work. UDOT will reimburse the Company 100% of the cost of Utility Work of its facilities located on a public utility easement, on a Company-owned private easement or fee property. The Company shall provide UDOT with a copy of the public utility easement or subdivision plat, private easement or fee title. The Utility Work and reimbursement for Company's facilities required by the Project will be in conformance with the requirements of Utah Administrative Code R930-8.

The Company shall submit itemized bills covering its actual costs incurred for performing the Utility Work covered by supplemental agreements to UDOT's Contracts and Compliance Specialist:

DRAFT

UDOT Contracts and Compliance Specialist
Utah Department of Transportation
PO Box 141510
SLC UT 84114-1510

Itemized bills shall bear the Project and supplemental agreement numbers, supporting sheets, and a complete billing statement of all actual costs incurred, following the order of the items in the detailed estimates contained in the supplemental agreement, and be submitted to UDOT within 60 days following completion of the Utility Work by the Company on the Project. Otherwise, previous payments to the Company may be considered final, except as agreed to between the Parties in advance. UDOT will reimburse the Company within 60 days after receipt of the billings, but only for those items complying fully with the provisions of Utah Administrative Code R930-8. Failure on the part of the Company to submit final billings within 6 months of the completion of the Utility Work will result in UDOT's disallowance of that portion of Utility Work reimbursement.

If the Company owes a balance to UDOT, the Company will reimburse UDOT within 60 days after receipt of billing from UDOT.

20. SALVAGE CREDIT

In accordance with 23 C.F.R. §645.117 all materials from Company's existing facilities which are recovered by UDOT while performing the Utility Work and not reused on this Project shall become the property of the Design-Builder unless otherwise agreed to in advance by the Parties hereto.

In accordance with 23 C.F.R. §645.117, all materials from the existing facilities, which are recovered in suitable condition for reuse by the Company and not reused on the Project, shall be credited to the cost of the Project at current stock prices. If the materials are not suitable for reuse, they shall be credited at such other prices as agreed upon between the Company and UDOT following inspection of the recovered material.

21. PROJECT DESIGN CHANGES

If UDOT changes the Project design after the Company has completed its design review; or if the Company has completed its portion of the Utility Work of its facilities based on previously approved design plans; the cost of the second design review and/or Utility Work is to be paid in full by UDOT. UDOT will make adjustments for any additional time that may be required for the Company to perform Utility Work on its facilities when required.

22. COMPANY'S COSTS DIFFER BY MORE THAN 10%

If the Company's actual costs incurred for its force account work differs more than 10% plus or minus per line item from the amount contained in the supplemental agreements, the Company is required to submit a letter of explanation with its billings indicating how and why the difference in costs occurred.

DRAFT

23. **RIGHT TO AUDIT**

UDOT and FHWA shall have the right to audit all cost records and accounts of the Company pertaining to this Project in accordance with the auditing procedure of the Federal Highway Administration and 23 C.F.R. §645, subpart A. Should this audit disclose that the Company has been underpaid, UDOT will reimburse the Company within 60 days upon submission of additional billing to cover the underpayment. Should this audit disclose that the Company has been overpaid, the Company will reimburse UDOT within 60 days of notification of audit findings in the amount of the overpayment. For the purpose of audit the Company is required to keep and maintain its records of Utility Work covered herein for a minimum of 3 years after final payment is received by the Company from UDOT.

The Company shall have the right to review UDOT's cost documentation for the Utility Work performed on behalf of the Company.

24. **ACCEPTANCE**

UDOT will provide notification to the Company for acceptance of the Utility Work upon completion of the final inspection. Company will have 60 days to respond in writing to UDOT with any additional comments in regards to the Utility Work. In the event that UDOT does not receive a written response within 60 days, UDOT will designate the Utility Work accepted by the Company. Upon acceptance of the Utility Work, the Company will accept, own and maintain its facilities. To the extent it may lawfully do so, Company further agrees to relieve UDOT from any responsibility or liability that may result for its new facilities or the operation thereof.

25. **ACCESS & MAINTENANCE**

Access for maintenance and servicing of Company's facilities located on the Project right-of-way will be allowed only by permit issued by UDOT. Company will obtain the permit and abide by conditions thereof for policing and other controls in conformance with Utah Administrative Code R930-7.

26. **MISCELLANEOUS**

a. Each Party agrees to undertake and perform all further acts that are reasonably necessary to carry out the intent and purpose of this Agreement at the request of the other Party.

b. This Agreement in no way creates any type of agency relationship, joint venture, or partnership between UDOT and Company.

c. The failure of either Party to insist upon strict compliance of any of the terms and conditions, or failure or delay by either Party to exercise any rights or remedies provided in this Agreement, or by law, will not release either Party from any obligations arising under this Agreement.

d. This Agreement shall be deemed to be made under and shall be governed by the laws of the State of Utah in all respects. Each person signing this Agreement warrants that the person has full legal capacity, power, and authority to execute this Agreement for

DRAFT

and on behalf of the respective Party and to bind such Party. This Agreement may be executed in one or more counterparts, each of which shall be an original, with the same effect as if the signatures were made upon the same instrument. This Agreement may be delivered by facsimile or electronic mail.

SUPPLEMENTAL AGREEMENT NO. ___

Supplement to UDOT Finance No. _____

THIS SUPPLEMENTAL AGREEMENT, made and entered into this _____ day of _____, 20____, **Utah Department of Transportation**, ("UDOT"), and **MCI Communication Services**, a Delaware Corporation, ("Company") each as ("Party") and jointly as ("Parties").

The Parties hereto entered in to a Master Utility Agreement (MUA) dated _____, UDOT Finance No. _____. All the terms of the MUA remain in full force and effect unless otherwise specified herein.

The Parties agree as follows:

1. UDOT and Company will perform the following described Utility Work in accordance with the terms and conditions of the MUA:

   a. Description of Utility Work to be performed, including proposed location, described in Exhibit "A" that is incorporated by reference: (Plan Sheets Attached)

   b. The Company requirements as shown in the MUA – Company Requirements, are modified as follows:

   c. Anticipated duration of Utility Work as shown on Exhibit "B" that is incorporated by reference:

   d. Betterments included:

TOTAL ESTIMATED COST OF SUPPLEMENTAL AGREEMENT _____	**$0.00**
TOTAL ESTIMATED COST OF COMPANY PERFORMED UTILITY WORK	$0.00
TOTAL ESTIMATED COST OF UDOT PERFORMED UTILITY WORK	$0.00
COMBINED TOTAL ESTIMATED COST OF UTILITY WORK	**$0.00**
TOTAL ESTIMATED AMOUNT OF COMPANY PARTICIPATION @ 50%	$0.00
TOTAL ESTIMATED AMOUNT OF UDOT PARTICIPATION @ 50%	$0.00

2. UDOT will notify the Company's contact person, David McAllister, Telephone No. (303) 214-7115, email david.mcallister@verizon.com at least 48 hours in advance of beginning the Utility Work covered herein, or in accordance with the specific terms of the MUA, as applicable.

E 25592 178083

Statewide Agreement Covering the Coordination and Reimbursement for **COMPANY's** Facility Adjustments and Relocations Throughout the State of Utah
QUESTAR GAS COMPANY

STATEWIDE UTILITY RELOCATION AGREEMENT

THIS STATEWIDE UTILITY RELOCATION AGREEMENT, (Agreement) is made and entered into this 19 day of July, 20 16, by and between the **UTAH DEPARTMENT OF TRANSPORTATION**, hereinafter referred to as "**UDOT**" and **QUESTAR GAS COMPANY**, a Registered Corporation in the State of Utah, hereinafter referred to as the "**COMPANY**." The Utah Department of Transportation and Questar Gas Company are referred to herein individually as a "Party" or collectively as the "Parties."

RECITALS:

WHEREAS, UDOT has jurisdiction over State Highway Rights of Way and administers the programming, development and completion of State and Federal-aid eligible projects (referred to herein as Project or collectively as Projects); and

WHEREAS, COMPANY is a natural gas utility and owns natural gas facilities (Facilities), that are located within State Highway Rights of Way under a Statewide Utility License Agreement and within **COMPANY** owned easements or fee title property; and

WHEREAS, certain Projects will require the relocation, adjustment, or protection of **COMPANY** Facilities, and the **COMPANY** is required by State Law to perform this work (Utility Work) when necessary to accommodate a Project; and

WHEREAS, to expedite the Utility Work and reimbursement of Utility Work on Projects, it is the desire of the Parties to enter into this Agreement with the understanding that the Parties will enter into future Project Agreements, which are supplemental to this Agreement, to address the scope of work, schedule, reimbursement amounts, and other requirements for each Project; and

WHEREAS, this Agreement, along with the Project Agreements shall govern the terms and conditions for each Project;

NOW, THEREFORE, for good and valuable consideration, the receipt and sufficiency of which hereby acknowledged, the Parties agree to the following terms and conditions.

TERMS AND CONDITIONS

1. PROJECT IDENTIFICATION AND DEVELOPMENT

A. For each Project the Parties agree to enter into a Project Agreement. **UDOT** will prepare a Project Agreement in substantially the same form as the agreement attached hereto as Exhibit A. All terms in the Project Agreements shall be supplemental to the terms of this Agreement. In the case of an inconsistency between the terms of this Agreement and the terms of a Project Agreement, the terms of the Project Agreement shall control.

B. In some cases, particularly when **UDOT** engages a Design Builder or a Construction Manager General Contractor, the Parties may enter into Supplemental Agreements to the Project

Agreement. In this case, the Project Agreement may be limited to contact information and a description of anticipated work. The Supplemental Agreements will address Utility Work for specific Project locations and include a description of the work, the Party to perform the work, the location of the work, the estimated duration of the work, an estimate of the cost to each Party, any proposed betterments, a plan showing the existing and proposed location of the Facilities, and any necessary right-of-way documents. The estimates contained in the Project Agreement and Supplemental Agreements will be based upon material and labor prices as of the date of the estimate and do not account for increases due to unforeseen circumstances in accomplishing the Utility Work.

2. PROJECT COORDINATION

A. During the request for proposal phase of any Design Build Project, **UDOT** shall schedule a meeting with **COMPANY** and **UDOT's** prospective contractors. The purpose of the meeting will be to determine if conflicts with the **COMPANY's** Facilities can be avoided and to provide prospective contractors with parameters within which **COMPANY's** Facilities can be relocated. **COMPANY** and **UDOT** will also meet one (1) time individually with each prospective contractor for the same purpose.

B. During the design phase of any Project, **UDOT** and **COMPANY** will work in good faith to identify the extent of any conflicts and propose and provide a mutually agreeable location to which the Facilities can be relocated. **UDOT** will provide the **COMPANY** with Project design plans as early as possible, and will schedule and meet with the **COMPANY** to review the right-of-way and environmental requirements, design, construction, cost estimates, and scheduling for the **COMPANY's** Utility Work at specific locations on the Project to ensure maximum lead time for advance order of materials and scheduling of work force.

C. **COMPANY** shall provide **UDOT** with an estimated time for completion of the Utility Work and any potential limitations including permit and regulatory approvals, dependency upon work of other parties, lead times for acquiring materials, outage windows, and scheduling work crews. **UDOT** will, by its standard specifications and/or special provisions, make its contractor aware of the coordination and cooperation required for timely completion of the Utility Work and will advise the contractor of the approximate schedule for completion of the Utility Work during Project advertisement. After UDOT awards the Project to its contractor, UDOT will schedule a meeting with the COMPANY and the COMPANY shall meet with UDOT's representative and UDOT's contractor to develop a detailed work plan and schedule for Utility Work. The COMPANY shall submit to UDOT written acknowledgement of the approved schedule. The **COMPANY** shall diligently pursue its work so that completion can be accomplished according to the approved schedule after receiving written authorization to proceed.

D. The **COMPANY** shall notify **UDOT**, or its contractor if so designated by **UDOT**, as soon as practicable but no later than two (2) working days of its discovery of any occurrence or unforeseen circumstances that would prevent the **COMPANY** from completing the Utility Work according to the time schedule established in the Project Agreement.

E. After the Project Agreement is executed by the Parties, any change in the scope of the work, extra work, or change in the planned work covered by this Agreement or the Project Agreement will be noted in the daily records and is valid only if made by written authorization and Change Order executed by both Parties prior to the start of the revised work. The **COMPANY** will provide to **UDOT** detailed estimates for the Change Order work. If the change of work is significant, **UDOT** may require a Supplemental Agreement.

3. COMPANY REQUIREMENTS

A. After design work is complete and the Project Agreement has been executed, **COMPANY** may require up to six (6) months for the acquisition of materials for high pressure (HP) Facilities and seven (7) weeks for acquisition of materials for intermediate high pressure (IHP) Facilities.

B. The Parties shall develop a Project schedule for the relocation of **COMPANY's** Facilities. Utility Work on **COMPANY** Facilities from October 1 through April 15 will be avoided, unless otherwise agreed to in writing. Utility Work between April 16 and September 30 may be performed depending upon the **COMPANY's** system requirements.

C. The Parties may agree to abandon retired lines in place in accordance with **UDOT** and **COMPANY** procedures. Abandoned lines remain the property of **COMPANY**. If abandoned lines are removed, **COMPANY** will perform the work and the cost of removal will be included in the Project costs and shared by **UDOT** and **COMPANY** under the terms of the Project Agreement.

4. UDOT PROJECT RESPONSIBILITIES

A. **UDOT**, through its contractors, will provide surveying and staking of roadway facilities as required by the **COMPANY,** in accordance with **UDOT's** Standard Specifications, Section 01721, Survey, 3.16, Utilities. The cost of the surveying and staking will be at **UDOT's** sole expense and the **COMPANY** will have no obligation for surveying. Any of **UDOT's** survey control stakes or bench markers which are removed or damaged by the **COMPANY** shall be reestablished by **UDOT** at **COMPANY's** expense.

B. **UDOT** will adjust any existing schedule to allow for any reasonable time that may be required for the **COMPANY** to redesign or modify its plans and relocate its Facilities when **UDOT** requires the redesign. If **UDOT** substantially changes the Project design after the **COMPANY** has completed or is in the process of completing its relocation design; or if the **COMPANY** has completed the relocation of its Facilities based on previously approved design plans, the cost of the second design and/or relocation is to be paid in full by **UDOT**.

C. In accordance with current policies and directives, **UDOT** may perform Subsurface Utility Engineering, Quality Levels A and B, within the limits of a Project. Additional work required to determine the vertical location of underground Facilities at specific, critical locations will be reviewed with the **COMPANY**. A summary of the costs will be provided to the **COMPANY**, and the **COMPANY's** proportional share of the actual cost will be withheld from the **COMPANY's** relocation reimbursement.

5. COMPANY TO DESIGN AND CONSTRUCT UTILITY WORK

A. **COMPANY**, with its regular engineering and construction forces at its standard schedule of wages and working hours, or through its qualified contractors with whom it has continuing contracts or has obtained contracts upon appropriate solicitation, shall perform the necessary design work, field and office engineering, and shall furnish all materials and perform the construction work on its Facilities, necessitated by the Project.

The need for overtime or other additional costs necessary to meet **UDOT's** schedule, allowable outage windows or available lane closures for the completion of the Utility Work will be evaluated and agreed upon in advance by the Parties. In performance of the Utility Work, the **COMPANY**

and its contractors will adhere to the requirements of Utah Administrative Codes R930-7 and R930-8.

B. **COMPANY**, while engaged in the adjustment or relocation of its Facilities, will comply with any applicable requirements of 23 C.F.R. § 635.410, Buy America Requirements. Buy America Certification forms, if required, shall be included in Project Agreements. **COMPANY** may require additional time for the acquisition of materials due to the Buy America requirements.

C. **COMPANY** shall include within its design of the relocated Facilities the clear zone requirements as defined in AASHTO's "Roadside Design Guide" and minimum vertical and horizontal clearances as defined in R930-7.

D. **COMPANY**, while engaged in the relocation of its Facilities shall comply with **UDOT's** Standard Specification for Road and Bridge Construction Section 01355, Subpart 1.13, Discovery of Historical, Archeological or Paleontological Objects if performing work within **UDOT's** right-of-way.

E. **COMPANY** provided traffic control devices shall conform to the standards set forth in the Manual on Uniform Traffic Control Devices (MUTCD) as adopted by **UDOT**. All flagging personnel shall be certified.

F. **COMPANY** employees and contractors working in the highway right-of-way shall comply with current requirements of MUTCD Section 6D.03. concerning high-visibility safety apparel.

6. COMPANY TO NOTIFY UDOT AND ITS CONTRACTOR BEFORE BEGINNING CONSTRUCTION WORK

Parties agree to cooperatively work together during construction, communicate frequently and coordinate the Utility Work. The **COMPANY** will notify **UDOT's** Project Representative as identified in the Project Agreement at least forty-eight (48) hours in advance of beginning any work. Such notification can be by telephone, email, in person or in writing. Subsequent notification of when and where the **COMPANY** will be performing work will be given by the **COMPANY** to **UDOT's** Project Representative on a day-to-day basis. In the event **COMPANY** fails to provide notice of work, which results in conflicts with other contractors on the Project site, **COMPANY** will demobilize its personnel and contractor at its own cost. Any work performed without proper notification to **UDOT's** Project Representative must be made available at **COMPANY's** expense for inspection by **UDOT** upon request or verified in another acceptable manner to **UDOT**. Failure on the part of the **COMPANY** to give proper notification to **UDOT** may result in **UDOT's** disallowance of reimbursement for that portion of the **COMPANY's** work performed while not under the surveillance of the **UDOT's** Project Representative.

7. DAILY RECORD KEEPING

UDOT, through its Project Representative, will keep a daily record of the Utility Work performed by the **COMPANY** for each Project, in a form acceptable to both Parties. The daily record shall be signed by **UDOT's** Project Representative and the **COMPANY**, or its authorized representatives, as required and a copy shall be retained by the Parties to this Agreement. If emergencies occur requiring the **COMPANY's** work forces to leave the job, record keeping shall be resumed upon return to the Project.

8. EMERGENCY WORK

When the **COMPANY** experiences an emergency unrelated to its work on the Project, it will take care of said emergency, after which it will again notify **UDOT** as to when work will be resumed on the Project.

9. REIMBURSEMENT FOR COMPANY'S UTILITY WORK

A. Reimbursement eligibility will be determined in accordance with Utah Code Section 72-6-116 and Utah Administrative Code R930-8.

B. Reimbursable costs for the Utility Work will be developed in accordance with 23 C.F.R. § 645, Subpart A. The **COMPANY** will submit itemized bills covering its actual costs incurred for performing the work covered by the Project Agreements hereto, bearing the Project number together with supporting sheets on a monthly or quarterly basis.

C. **COMPANY** will send one (1) final and complete billing of all actual costs incurred within six (6) months following completion of Utility Work by the **COMPANY** on the Project to:

UDOT Contracts and Compliance Specialist
4501 South 2700 West, Box 148220
Salt Lake City, Utah 84114-8220

In the event **COMPANY** fails to send a final bill to **UDOT** within six (6) months of completion of its work, **UDOT** may send notice to **COMPANY** requesting a final bill. **COMPANY** will have forty-five (45) days to respond with a final bill or will forfeit payment for the unbilled portion of the work. Both Parties agree to cooperatively work together in good faith to resolve any disputes on the final billing within sixty (60) days after **UDOT** receives the final bill from **COMPANY**. **UDOT** will reimburse the **COMPANY** within sixty (60) days after receipt of said billings or after disputes on final bill are resolved. Reimbursement will be limited to items complying fully with the provisions of 23 C.F.R. § 645, Subpart A.

10. BETTERMENT WORK

Betterment work is defined as set forth in 23 C.F.R. § 645, Section 645.105, Definitions. Specifically, betterment is "any upgrading of the facility being relocated that is not attributable to the highway construction and is made solely for the benefit of and at the election of the utility". If the **COMPANY** desires to include betterment in the Utility Work at any specific location, **UDOT** will allow betterment work to be performed, provided the Parties can reasonably coordinate the Project schedule to accommodate the betterment work without delaying the Project. The difference in costs between the minimum construction required as a result of the Project and the **COMPANY's** desired construction shall be made at the sole expense of **COMPANY**.

11. SALVAGE CREDIT

All materials from the existing Facilities, which are recovered in suitable condition for reuse by the **COMPANY** and not reused on the Project, shall be credited to the cost of the Project at current stock prices in accordance with 23 C.F.R. § 645.117. If the recovered materials are not suitable for reuse, they shall be credited at salvage prices, if any, or such other prices as agreed upon between the **COMPANY** and **UDOT** following inspection of the recovered material.

12. COSTS DIFFER BY MORE THAN TEN PERCENT

The **COMPANY's** final billings of completed Utility Work should follow as closely as possible the order of the items in the detailed estimates contained in the Project Agreements or Supplemental Agreements, and will be provided in a format that allows comparisons to be made with the approved plans and estimates. If the **COMPANY's** actual costs incurred for its force account work differs more than ten percent (10%) plus or minus per cost category from the estimated amount contained in the Project Agreements or Supplemental Agreements, the **COMPANY** is required to submit a letter of explanation with its billings indicating how and why the difference in costs occurred.

13. AUDIT

UDOT and the Federal Highway Administration shall have the right to audit all cost records and accounts of the **COMPANY** pertaining to the Project in accordance with 23 C.F.R. § 645, Subpart A. Should this audit disclose that the **COMPANY** has been underpaid, the **COMPANY** will be reimbursed by **UDOT** upon submission of additional billing to cover the underpayment. Should this audit disclose that the **COMPANY** has been overpaid, the **COMPANY** will reimburse **UDOT** in the amount of the overpayment. For the purpose of audit the **COMPANY** is required to keep and maintain its records of Utility Work covered herein for a minimum of three (3) years after final payment is received by the **COMPANY** from **UDOT**.

14. RIGHT-OF-WAY ACQUISITION

COMPANY owns rights-of-way, easements and fee property (collectively the Existing Property) from which Facilities are relocated to accommodate Projects. For all Existing Property **COMPANY** relinquishes to accommodate a Project, **UDOT** will replace the property with new property (collectively, the New Property). The New Property will be at a location agreeable to both Parties, with dimensions comparable to the Existing Property, and the terms of the conveyance documents shall be acceptable to **COMPANY**. For New Property that **UDOT** may acquire through eminent domain, **COMPANY** may elect to have **UDOT** acquire such New Property on behalf of **COMPANY**. In the event **COMPANY** elects to have New Property with dimensions greater than the dimensions of the Existing Property, **COMPANY** shall be responsible for the incremental costs due to the increased dimensions of the New Property unless the increased dimensions are required by law or regulation.

15. FORCE MAJEURE

An event of force majeure is an unforeseeable event or circumstance which is beyond the control and without the fault or negligence of the party affected and which by the exercise of reasonable diligence the party affected was unable to prevent, including without limitation strikes, riots, earthquakes, epidemics, sabotage, terrorist actions, wars, fires, floods, weather, materials shortage, power failure, telecommunications outage, acts of God, governmental restrictions, regulations or controls, judicial orders, or other failures, interruptions or errors not directly caused by the parties.

Neither party is responsible for any failure to perform its obligations under this Agreement if it is prevented or delayed in performing those obligations by an event of force majeure. Only those obligations directly affected by an event of force majeure are excused.

Where there is an event of force majeure, the party prevented from or delayed in performing its obligations in this Agreement must immediately notify the other party giving full particulars of the event of force majeure preventing that party from, or delaying that party in performing its obligations in this Agreement and that party must use its reasonable efforts to mitigate the effect of the event of force majeure upon its performance of the contract and to fulfill its obligations.

Upon completion of the event of force majeure, the party affected must as soon as reasonably practicable recommence the performance of its obligations in this agreement. If the affected party is the Company, the Company must provide a revised schedule to minimize the effects of the prevention or delay caused by the event of force majeure.

An event of force majeure does not relieve a party from liability for an obligation to perform according to the Agreement. Neither party shall be responsible to the other for any costs or losses caused by the event of force majeure.

16. CONFIDENTIAL INFORMATION

UDOT is subject to the requirements of the Government Records Access Management Act ("GRAMA") or other applicable law. If Company provides a record that it believes should be protected pursuant to Utah Code Section 63G-2-305(1) or (2), the Company shall comply with Utah Code Section 63G-2-309 and mark the documents as confidential.

17. TERM AND TERMINATION

A. This Agreement expires five (5) years from the date of execution. Upon expiration of this Agreement, the parties will negotiate in good faith the terms of renewal. The terms and conditions of this Agreement will remain in effect until the new agreement between the parties becomes effective, but in no event shall such renewal period exceed twelve (12) months following expiration of this Agreement unless otherwise agreed to by the Parties.

B. This Agreement may be terminated by either party by providing sixty (60) day written notice of termination. Any such termination shall not affect the validity of any previously executed Project Agreement or Supplemental Agreement. Notice shall be given as follows:

UDOT:	Questar Gas Company:
UDOT Legal Counsel 4501 South 2700 West P.O. Box 148455 Salt Lake City, UT 84144	Questar Gas Company General Counsel P.O. Box 45360 Salt Lake City, UT 84145

18. ASSIGNMENT:

COMPANY may assign or transfer its rights and obligations under this Agreement to any parent, affiliate, or subsidiary of COMPANY, to any entity having fifty percent (50%) or more direct or indirect common ownership with COMPANY, or to any successor-in-interest, provided the assignee or transferee

agrees to be bound by all terms and conditions of this Agreement. Otherwise, COMPANY shall not transfer, assign or delegate its rights or obligations under this Agreement without the prior written consent of UDOT. This Agreement shall be binding upon and inure to the benefit of the Parties' permitted successors and assigns.

19. MISCELLANEOUS

A. In the event of any dispute relating to this Agreement, resulting in litigation, the prevailing Party shall be entitled to recover all costs, including reasonable attorney fees.

B. The provisions of this Agreement are severable, and should any provision be deemed void, unenforceable or invalid, such provision shall not affect the remainder of this Agreement.

C. This Agreement shall be governed by the laws of the State of Utah.

D. This Agreement supersedes the previously executed STATEWIDE UTILITY RELOCATION AGREEMENT between the Parties dated November 4th, 2009.

****

IN WITNESS WHEREOF, the Parties hereto have caused this Agreement to be executed by their duly authorized officers as of the day and year first above written.

PROJECT AGREEMENT

Supplement to Statewide Utility Relocation Agreement, Finance No. 160000

THIS PROJECT AGREEMENT, made and entered into this _____day of _____, 20__, by and between the **UTAH DEPARTMENT OF TRANSPORTATION**, hereinafter referred to as "**UDOT**" and **QUESTAR GAS COMPANY**, a Registered Corporation in the State of Utah, hereinafter referred to as the "**Company**."

This Project Agreement is part of and subject to the terms and conditions of the **STATEWIDE UTILITY RELOCATION AGREEMENT** dated _____ **UDOT** Finance No. 160000, hereinafter referred to as "Statewide Agreement". All the terms of the Statewide Agreement remain in full force and effect unless otherwise specified herein.

The parties hereto agree as follows:

1. **Company's** contact person for the Project is, [insert name], telephone number (XXX) XXX-XXXX and email, XXXX@XXXX.com.

   UDOT's Project Representative is [Insert name and title], telephone number (XXX) XXX-XXXX and email XXXXX@utah.gov.

   UDOT's Resident Engineer is [Insert name], telephone number (XXX) XXX-XXXX and email XXXX@utah.gov.

2. The **Company** will perform the following described Utility Work in accordance with the terms and conditions of the Statewide Agreement.

   Location of Utility Work:

   Description of Utility Work to be performed, including proposed location:

   (Plan Sheets and Right of Way Documents attached as "**EXHIBIT A**", that is incorporated by reference.)

   Party performing the Utility Work:

   Anticipated duration of Utility Work:

   Estimated dates of Utility Work:
   (Includes allowable outage windows)

   Estimated Total Cost of Utility Work:
   (Detailed Estimate attached)

Betterments Included:

*[**UDOT** and **Company** will discuss and include these items in Project Agreement if applicable:*

- *Party responsible for and timing of removal of pavement, other hard surface, trees, fencing, signs, buildings etc.*
- *Party responsible for backfill, material and compaction requirements for backfill.*
- *Party responsible for final grading and hard surface restoration.*
- *Party responsible for traffic control, including safety barriers, plates, and restrictions/requirements for lane closures.]*

3. Utility Work to be completed under this Project Agreement is subject to the following:

Special Provisions

- Buy America. [*List specific Buy America requirements applicable to this Project.*] Specific certification requirements are marked "**EXHIBIT C**" that is incorporated by reference.

- Other limitations to the Project.

  [***UDOT** and **Company** will discuss and include these items in Project Agreement if applicable:*
  - *Limits of loading over pipe, including cover/equipment restrictions*
  - *High pressure inspection*
  - *Night Work]*

4. The **Company** shall be reimbursed by **UDOT** for XXX% of the actual costs incurred by the **Company** for performing the Utility Work covered herein. An estimate of the total cost of said Utility Work was furnished by the **Company** to **UDOT** in the total amount of $_____. A copy of the details of the estimate are marked "**EXHIBIT B**" that is incorporated by reference.

TOTAL ESTIMATED COST TO UDOT IS $_____

TOTAL ESTIMATED COST TO THE COMPANY IS $_____

NOTE: The above are estimates only. Total payment to the **Company** by **UDOT** will be based on the actual costs incurred as determined after completion of construction.

5. Upon signature and return of this Project Agreement to **UDOT**, the **Company** is authorized to proceed with the Utility Work covered herein.

STATEWIDE UTILITY RELOCATION AGREEMENT

between

Utah Department of Transportation

&

PacifiCorp -24210

This Statewide Utility Relocation Agreement (referred to herein as Agreement), made and entered into this 7 day of Dec, 20 15, by and between the UTAH DEPARTMENT OF TRANSPORTATION, hereinafter referred to as "UDOT" and Rocky Mountain Power, an unincorporated division of PACIFICORP, an Oregon Corporation, hereinafter referred to as the "Company" or "RMP". The Utah Department of Transportation and Rocky Mountain Power are referred to herein individually as a "Party" or collectively as the "Parties."

RECITALS

1. UDOT has jurisdiction over state Highway rights of way and administers the programming, development and completion of State and Federal-aid eligible projects (referred to herein as "Project" or collectively as "Projects") in Utah.

2. RMP is a regulated electricity utility serving Utah, and owns, operates and maintains an extensive utility infrastructure, including transmission and distribution wirelines, poles, vaults, substations, plants and all associated facilities (referred to herein as "Facilities"). Some Facilities are located within State highway rights-of-way under Statewide Utility License Agreements.

3. Certain projects to expand or alter the transportation infrastructure occasionally necessitate the protection or relocation of Facilities.

4. The Parties have entered into an agreement titled Statewide Agreement for the Acquisition or Replacement of Utility Easements and Rights of Way, dated the 19th day of January 2005 that sets forth the manner in which property interests are addressed for the relocation of Facilities.

5. For the purpose of expediting the performance and reimbursement of the relocation work on Projects, it is the desire of the Parties to enter into this Agreement with the understanding that the Parties will enter into future Project Agreements which are supplemental to this Agreement which will address the scope of work, schedule, reimbursement amounts, and other requirements for each specific Project.

AGREEMENT

NOW THEREFORE, in accordance with the foregoing Recitals, which are incorporated into this Agreement by reference, and for and in consideration of the mutual covenants and agreements hereafter set forth, the mutual benefits to the Parties to be derived herefrom, and other valuable consideration, the receipt and sufficiency of which the Parties acknowledge, it is hereby agreed as follows:

1. Notification and Preliminary Design. UDOT will notify the Company of Projects where Company Facilities may require relocation or protection in place and will meet with the Company to review and discuss proposed Project plans.

2. Project Meetings. The Parties will participate in periodic Project status meetings, to be held at such times and places as the Parties mutually agree.

3. Company and UDOT Design Coordination. The Company and UDOT shall consult in good faith to reasonably minimize Facility relocation costs, Project costs and delays and determine an appropriate Project strategy for each potentially impacted Facility. The Parties will share Project design details throughout the design process. Company will submit documentation of existing property rights for Facilities within the proposed project limits as early as possible and proposed property rights needed as a result of the Project and Facility relocation designs.

4. Relocation Design, Betterments, Estimate and Construction Duration.

a. The Company, with its regular engineering forces at its standard schedule of wages and working hours, or through its qualified contractors with whom it has continuing contracts or has obtained contracts pursuant to a competitive process, shall diligently perform the necessary design, field and office engineering. Designs will adhere to Company's current standards. The Company may use external consultants to oversee any or all aspects of design, and permitting.

b. The Company will submit to UDOT any betterment requests as early as possible. UDOT will allow for betterment work to be performed, provided the Parties can reasonably coordinate the Project schedule to accommodate the betterment work without delaying the Project. Betterment is defined as set forth in 23 CFR, Section 645.105. Specifically, betterment is any upgrading of the Facility being relocated that is not attributable to the highway construction and is made solely for the benefit of and at the election of the Company. Betterment credit to a Project is not required for improvements which are required by law under governmental and appropriate regulatory commission code, or required by current design practices regularly followed by the Company in its own work, and there is a direct benefit to the highway project. The Company will be responsible for increased costs due to betterment. The actual costs for the Company's participation shall be determined upon completion and final billing for the relocation work.

c. UDOT may perform Subsurface Utility Engineering, Quality Levels A and B, within the limits of a Project. Additional work required to determine the vertical location of underground facilities at specific locations will be reviewed with the Company and subject to the proportional cost share as set forth in the Project Agreement.

d. UDOT and Company will work together in good faith to identify and resolve conflicts between the Project and Company's Facilities. UDOT acknowledges that, for typical projects, Company's design requires up to three (3) months for both underground and overhead power lines after approved roadway design plans are delivered to the Company. Facility design for relocation of transmission Facilities may require significantly longer lead time.

e. The Company shall include within its design of the relocated Facilities within UDOT's right of way the minimum vertical and horizontal clearances as defined in Utah Administrative Code R930-7 Utility Accommodation, as amended.

f. Company will submit to UDOT the Company's proposed design; detailed cost estimates; a reasonable construction duration including all known limitations including permit and regulatory approvals, anticipated outage windows, advance ordering of materials, dependency upon work of

other parties, and scheduling of work crews; communication contacts; and other details necessary for UDOT to prepare contract documents and a Project Agreement.

5. Project Agreements.

a. For each Project, UDOT will prepare a Project Agreement. In the case of an inconsistency between the terms of this Agreement and the terms of a Project Agreement, the terms of the Project Agreement shall control, unless expressly stated otherwise. The Project Agreement form is attached as "EXHIBIT A".

b. The Company shall designate a representative in the Project Agreement, who will be the Company's liaison with respect to the matters covered by the Project Agreement. The Company's representative shall coordinate with UDOT's Utilities Coordinator for the Project regarding the matters described in the Project Agreement.

6. Rights of Way. The replacement of rights-of-way shall be consistent with the terms and conditions set forth in the Statewide Agreement for the Acquisition or Replacement of Utility Easements and Rights of Way and Utah Administrative Code R930-8. In the event of a conflict Utah Administrative Code R930-8 controls.

7. UDOT Contractor Selection process. UDOT will engage in its process to bid and award Project work to a contractor. During the proposal phase of any Design Build Project, at UDOT's discretion, the Company and UDOT will meet with each prospective contractor to review the preliminary design with UDOT's bidders.

8. Notice to Proceed.

a. The Company shall not commence performing the work under any Project Agreement until the Project Agreement is executed by both Parties and the Company is authorized in writing by UDOT to begin work.

b. UDOT, through its contractors, will provide surveying and staking of roadway facilities as required by the Company, in accordance with UDOT's Standard Specifications, Section 01721, Survey, 3.16, Utilities. The cost of the surveying and staking will be at UDOT's expense and will not be recovered from the Company. Any of UDOT's survey control stakes or bench markers which are removed or damaged by the Company shall be reestablished by UDOT at Company's expense.

c. UDOT will adjust any existing schedule to allow for any reasonable time that may be required for the Company to redesign or modify its plans and relocate its Facilities when UDOT requires the redesign.

9. Company to Construct.

a. The Company, with its regular engineering and construction forces at its standard schedule of wages and working hours, or through its qualified contractors with whom it has continuing contracts or has obtained contracts pursuant to a competitive process, shall perform the necessary design work, construction and relocation work with commercially reasonable diligence. The Company may use external consultants to oversee any or all aspects of permitting, construction and relocation.

b. The Company while engaged in the relocation of its Facilities shall comply with UDOT's Standard Specification for Road and Bridge Construction Section 01355, Subpart 3.8, Discovery of Historical, Archeological or Paleontological Objects, Features, Sites, or Human Remains if performing work within UDOT's right-of-way.

c. Company provided traffic control devices shall conform to the standards set forth in the Manual on Uniform Traffic control Devices ("MUTCD") as adopted by UDOT. All flagging personnel shall be certified.

d. Company employees and contractors working in the highway right-of-way shall comply with current requirements of MUTCD Section 6D.03, concerning high-visibility apparel.

e. The Company shall notify UDOT's Project Representative as identified in the Project Agreement at least forty-eight (48) hours in advance of initiating construction under the Project Agreement. Subsequent notification of when and where the Company will be performing work will be given by the Company to UDOT's Project Representative on a day-to-day basis. In the event the Company fails to give proper notification to UDOT and UDOT's Project Representative is not available to execute the daily work record, UDOT may disallow reimbursement for that portion of the Company's work performed while not under the surveillance of UDOT's Project Representative. Notwithstanding the foregoing, in the event UDOT's Project Representative is not present while work is being performed despite notice having been given by the Company, then UDOT may not disallow reimbursement for such work for the sole reason that UDOT's Project Representative was not present. At its election, UDOT shall be permitted to observe the performance of all construction. The Company and its contractors will perform their work in adherence with the requirements of Utah Administrative Code R930-7 Utility Accommodation, as amended.

10. Company to Perform Work Consistent With Project Schedule.

a. The Parties hereby acknowledge the importance of completing the work in a manner consistent with the overall schedule for the Project. Accordingly, the Parties shall coordinate and agree upon a schedule for the design, construction and final completion of the work, including any Company elected betterment work to be performed by the Company in conjunction with the work. The Parties shall execute a written acknowledgement of the approved schedule which shall, upon execution, be incorporated into and made a part of a Project Agreement.

b. The Company agrees to begin its work as soon as possible after having received a written authorization to proceed and to use reasonable efforts to complete all work in accordance with the agreed upon schedule. The need for additional costs necessary to meet the Project schedule will be evaluated and agreed upon in advance by the Parties.

c. The Company shall notify UDOT within seventy two (72) hours of its discovery of any occurrence or unforeseen circumstances that would prevent the Company from completing its work according to the agreed upon Project schedule.

d. When the Company experiences an emergency unrelated to its work on the highway Project, it will address of said emergency, after which the Company will again notify UDOT as to when work will be resumed on the Project.

11. Daily Record Keeping. UDOT, through its Project Representative, will keep a daily record of the relocation work performed by the Company. The daily record shall be signed by UDOT's Project Representative and the Company's authorized representative and a copy shall be retained by the Parties to this Agreement. If emergencies occur requiring the Company's work forces to leave the job, record keeping shall be resumed upon return to the Project.

12. Change in Work. After each Project Agreement is executed by the Parties, significant changes in the planned scope of work covered by the Project Agreement or extra work is valid only if made in writing and executed by both Parties prior to the start of the revised work or extra work.

13. Standard of Care. The Company shall be solely responsible for the performance of all its work. The Company (including its contractors, consultants and other agents) shall perform all work in a good and workmanlike manner and in conformance with all applicable federal, state and local laws and regulations.

14. Company to Submit Invoices for Reimbursable Work.

a. Reimbursement eligibility will be determined in accordance with Utah Code Section 72-6-116, as amended. Reimbursable costs for the relocation work will be limited to items complying fully with the provisions of 23 CFR Part 645, Subpart A

23 RM 07 Dec '15

b. The Company will submit itemized bills to UDOT covering Company's actual costs incurred for performing the work covered by the Project Agreements, bearing the Project number together with supporting sheets on a monthly or quarterly basis.

c. The Company shall submit to UDOT one final and complete billing within six months of completion of the work for the actual Project costs, together with supporting documentation. In the event Company fails to send a final bill to UDOT within six months of completion of its work, UDOT may send notice to Company requesting a final bill. Company will have 45 days to respond with a final bill or will forfeit payment for the unbilled portion of the work.

d. The Parties agree to cooperatively work together in good faith to resolve any disputes on billings. UDOT will reimburse the Company within sixty (60) days after receipt of Company's billings or after disputes are resolved.

e. The billings and supporting documentation shall be submitted to:

UDOT Contracts, Estimates and Agreements Specialist
4501 South 2700 West, Box 148220
Salt Lake City, Utah 84114-8220

RM 07 Dec '15

15. Salvage Credit. All materials from the existing Facilities, which are recovered in suitable condition for reuse by the Company and not reused on the Project, shall be credited to the cost of the Project at current stock prices in accordance with 23 CFR 645.117. If the recovered materials are not suitable for reuse, they shall be credited at salvage prices or such other prices as agreed upon between the Company and UDOT following inspection of the recovered material.

16. Company's Costs Differ by More Than 10%. The Company shall match its billings of completed work with the detailed estimates contained in the Project Agreements. If the Company's actual costs incurred for reimbursable work differs more than ten percent (10%) plus or minus from the estimated amount contained in the Project Agreements, the Company shall submit a letter of explanation to UDOT with its billings describing how and why said difference in costs occurred.

17. Audit. UDOT and the Federal Highway Administration shall have the right to audit all cost records and accounts of the Company pertaining to the Project in accordance with 23 CFR, Part 645, Subpart A. Should this audit disclose that the Company has been underpaid, the Company will be reimbursed by

UDOT upon submission of additional billing to cover the underpayment. Should this audit disclose that the Company has been overpaid, the Company will reimburse UDOT in the amount of the overpayment after written notice. For the purpose of audit the Company is required to keep and maintain its records of work covered herein for a minimum of three years after final payment is received by the Company from UDOT.

18. Buy America. Materials composed primarily of iron or steel that are permanently incorporated into the work on this project are subject to 23 CFR 635.410, Buy America requirements. Company's responsibility for "Buy America" compliance is limited to providing UDOT's Project Representative with signed supplier certifications (which may be in electronic form) at or prior to the time of installation, according to the specific instructions and format set forth in the attached "EXHIBIT B". Buy America Certification is required only for the following specific items identified by UDOT: (i) steel transmission or distribution pole structures (exclusive of any cross arms, guy wires and anchors, transformers, insulators, cutouts, surge arrestors, switches, hardware, fasteners, brackets, base plate, conductor or other separately-provided attachments to be ordered separately and thereafter affixed to the poles structures); (ii) steel or iron conduit and risers; (iii) steel rebar to be furnished in conjunction with: concrete foundations, concrete transmission or distribution pole structures, or any pre-fabricated concrete vaults or similar concrete structures; and (iv) grates and covers for utility vaults and similar structures. Company shall have no obligation to furnish Buy America certificates with respect to any other materials, and shall have no further obligations regarding the domestic content of goods furnished.

Company has developed estimating, supply chain and materials handling procedures to implement these requirements and agrees to follow such procedures. In the event that Company fails to furnish Buy America certificates for any of the foregoing items in accordance with these requirements, UDOT may withhold reimbursement with respect to those items. Except for claims involving Company's fraud, willful misconduct or gross negligence, in no event shall Company's liability for its failure to comply with this Section exceed the reimbursement value of the items for which Company has failed to deliver the required certificate.

19. Terms.

a. The provisions of this Agreement are severable, and should any provision be deemed void, unenforceable or invalid, such provision shall not affect the remainder of this Agreement.

b. This Agreement does not supersede or modify any applicable federal or state statute, regulation, or rule.

c. This Agreement shall be governed by the laws of the State of Utah and applicable federal law. Any litigation shall be instituted only in a court of competent jurisdiction, whether state or federal, located within the State of Utah.

d. This Agreement supersedes the previously executed Master Agreement, State of Utah, Finance No. 998240, between the Parties dated January 6th, 1999.

e. This Agreement may be terminated by either Party by providing 30 day written notice of termination to the other Party. Any such termination shall not affect the validity of any Project Agreement executed prior to the date of termination of this Agreement.

f. To the fullest extent permitted by law, each of the Parties hereto waives any right it may have to a trial by jury in respect of litigation directly or indirectly arising out of, under or in connection with this Agreement. Each Party further waives any right to consolidate any action in which a jury trial has been waived with any other action in which a jury trial cannot be or has not been waived.

****

IN WITNESS WHEREOF, the Parties hereto have caused this Agreement to be executed by their duly authorized officers as of the day and year first above written.

Purchase Order Number _____

INSTRUCTIONS FOR COMPLETING THE BUY AMERICA CERTIFICATE

A. All products manufactured from steel and iron must be manufactured in the United States to be considered domestic.
   1. All manufacturing processes of the steel and iron material in a product such as melting, rolling, extruding, machining, bending, grinding, drilling, and coating must occur within the United States.
   2. Nondomestic raw materials are permitted so long as the melting and all subsequent manufacturing processes occur domestically.
   3. Coating includes all processes that protect or enhance the value of the material to which the coating is applied. The material applied as a coating is not subject to Buy America.

B. Include as a minimum the following information for Material Certifications of Compliance for Buy America:
   1. Signed mill test report.
   2. Signed certification by each Fabricator and Manufacturer that has handled the steel or iron product affirming that every process, including the application of a coating, performed on the steel or iron product has been carried out in the United States.
   3. Material descriptions, quantities, and means of material identification such as heat numbers, lot numbers, and other industry identification markings for each process the material underwent so the final product can be tracked through a step process from melting to final product.
   4. Tracking of quantities is not required for coating operations.

C. Include all steel or iron materials that can't be substantiated as being of domestic origin in cost documentation for foreign steel or iron.

ROCKY MOUNTAIN POWER
PROJECT AGREEMENT NO. 1

Supplement to Statewide Utility Relocation Agreement

This Project Agreement is made and entered into this 19 day of July, 2016, by and between the UTAH DEPARTMENT OF TRANSPORTATION, an agency of the State of Utah hereinafter referred to as "UDOT" and Rocky Mountain Power, an unincorporated division of PACIFICORP, an Oregon Corporation, hereinafter referred to as the "Company" or "RMP", to that certain Statewide Utility Relocation Agreement between the Parties dated December 7, 2015, UDOT Finance No. 168511. All the terms of said Agreement remain in full force and effect unless otherwise specified herein.

The Parties hereto agree as follows:

1. **PROJECT INFORMATION**

   UDOT is preparing to request proposals for and award a design-build contract for the highway project identified as S-0154(12)11, 4 Interchanges on Bangerter Highway in Salt Lake County, Utah, hereinafter referred to as the "Project". UDOT's design-build contractor will complete the design and administer construction of the Project. The Project contractor will hereinafter be referred to as the "Design-Builder".

2. **PROJECT CONTACT INFORMATION**

   UDOT's Project Representative is Alana Spendlove, UDOT Project Utility and Railroad Leader, telephone number (801) 887-3462 and e-mail aspendlove@utah.gov.

   UDOT's Resident Engineer for 5400 South and 7000 South interchanges is Bryan Chamberlain, telephone number (801) 887-3405, and e-mail bchamberlain@utah.gov, or their designated representative, as assigned.

   UDOT's Resident Engineer for 9000 South and 11400 South interchanges is Ken Talbot, telephone number (801) 360-8750, and e-mail kentalbot@utah.gov, or their designated representative, as assigned.

   Company's Representative is Suzan Jensen, telephone number (801) 220-2444, and e-mail Suzan.Jensen@rockymountainpower.net.

3. **COMPANY PROJECT REQUIREMENTS**

   Company and UDOT shall conduct the Utility Work in accordance with the specific terms of the Statewide Utility Relocation Agreement.

   The Company shall not commence performing the Utility Work covered in any subsequent Project Agreement until each Project Agreement is executed by both Parties and the

Company receives an Authorization to Proceed letter from UDOT's Project Utility and Railroad Leader.

4. **UDOT PROJECT RESPONSIBILITIES**

After awarding the Project, UDOT will provide the Company with the Design-Builder contact information, hereinafter referred to as "Design-Builder Third Party Manager".

UDOT shall provide trenching, conduit, and bedding material per Company specifications for all underground Utility Work, unless otherwise agreed upon and coordinated through a Project Agreement with the Company. Reimbursement eligibility will be determined in accordance with Utah Code Section 72-6-116.

UDOT shall provide all coordination, survey, maintenance of traffic, traffic control, and clearing and grubbing for all Utility Work at no cost to the Company.

IN WITNESS WHEREOF, the Parties hereto have caused these presents to be executed by their duly authorized officers as of the day and year first written above.

THIS MASTER UTILITY AGREEMENT, made and entered into this _____day of_____, 20_____, by and between the **Utah Department of Transportation**, ("UDOT"), and the **City of South Jordan**, a Municipal Corporation of the State of Utah, ("City") each as ("Party") and jointly as ("Parties").

RECITALS

WHEREAS, UDOT is preparing to request proposals for and award a design-build contract for the highway project identified as Project Number S-0154(12)11, 4 Interchanges on Bangerter Highway in Salt Lake County, Utah, ("Project"); and

WHEREAS, the design-build contractor will complete the design and administer construction of the Project ("Design-Builder"); and

WHEREAS, UDOT has identified City facilities within the limits of the Project which may necessitate the relocation, protection, or adjustment of the facilities, ("Utility Work"); and

WHEREAS, City desires for the Design-Builder to design and perform the Utility Work on the City's facilities necessitated by the Project; and

WHEREAS, City will perform the necessary design review and inspection to accommodate the Project; and

WHEREAS, for the purpose of expediting any required Utility Work and reimbursement, the Parties are entering into this Project Master Utility Agreement with the understanding that future supplemental agreements to this Agreement will be entered into covering the Utility Work to be accomplished by UDOT at specific Project locations.

THIS AGREEMENT is made to set out the terms and conditions where under the Utility Work shall be performed.

DRAFT

AGREEMENT

NOW THEREFORE, the Parties agree as follows:

1. PROJECT RESPONSIBLE FOR COST

In accordance with Utah Code § 72-6-116(3)(a)(ii), UDOT is responsible for 100% of the cost of the Utility Work of City's facilities for those costs that comply with Utah Administrative Code R930-8.

2. CONTACT INFORMATION

UDOT's Project Representative is Alana Spendlove, UDOT Project Utility and Railroad Leader, telephone number (801) 887-3462, and e-mail aspendlove@utah.gov.

UDOT's Resident Engineer for 5400 South and 7000 South interchanges is Bryan Chamberlain, telephone number (801) 887-3405, and e-mail bchamberlain@utah.gov, or his designated representative, as assigned.

UDOT's Resident Engineer for 9000 South and 11400 South interchanges is Ken Talbot, telephone number (801) 360-8750, and e-mail kentalbot@utah.gov, or his designated representative, as assigned.

UDOT's Field Representative contact person will be identified in subsequent supplemental agreements.

City's contact person is Brad Klavano, City Engineer, telephone number (801) 254-3742, and e-mail bklavano@sjc.utah.gov, or his designated representative, as assigned.

After awarding the Project, UDOT will provide the City with the Design Builder contact information, hereinafter referred to as "Design-Builder Project Representative".

3. AUTHORIZATION FOR DESIGN WORK

To facilitate coordination and obtain technical information about City's facilities and requirements for inclusion in this Agreement and the Request for Proposals, UDOT gave City authorization for preliminary design engineering on April 26, 2016.

4. SUBSURFACE UTILITY ENGINEERING

UDOT has performed Subsurface Utility Engineering (SUE) within the limits of the Project. UDOT shall review with City additional SUE work to determine the precise location of underground facilities at specific, critical locations on the Project.

DRAFT

5. PROJECT COORDINATION

City requested that UDOT include items of Utility Work for relocating and adjusting City's facilities in the Project.

During the development of the Project design, City and UDOT, along with its Design-Builder, shall consult as necessary in an effort to determine if conflicts with City's facilities can be avoided. If Utility Work for City's facilities is required by the Project, UDOT shall be responsible to identify the conflicts and to design and construct the Utility Work of City's facilities. City shall perform the necessary design reviews prior to the start of Utility Work. UDOT's Project Representative shall be responsible for coordinating with other utility companies as it relates to City's facilities.

6. CITY REQUIREMENTS

UDOT will comply with the following City Utility Work requirements**:**

a. UDOT shall supply as-constructed plans, in PDF format, upon completion of any required Utility Work.

7. UDOT TO DESIGN AND CONSTRUCT CITY'S UTILITY WORK

UDOT shall schedule and meet with City to review the design and scheduling of the Utility Work for City's facilities at specific locations on the Project to ensure maximum lead time for advance order of materials and work force scheduling.

a. UDOT shall design the Utility Work in accordance with City's standards regularly followed by City in its own work and not considered a betterment. If there is a conflict between UDOT and City standards, the higher standard will be applied. A copy of City's standards can be found at http://www.southjordancity.org/engineering-CSS.asp that is incorporated by reference.
b. UDOT will secure permits required for Utility Work of City's facilities.

8. RIGHT-OF-WAY

Any easements or replacement right-of-way required in conjunction with the Utility Work of City's facilities shall be acquired by UDOT in accordance with the requirements of Utah Administrative Code R930-8.

9. BETTERMENT WORK

City Aesthetics and Landscaping Betterment Work ("Betterment Work") is described in attached Exhibit "A" that is incorporated by reference.

If City desires to include additional betterment work in the Project at any specific location UDOT may agree to the betterment provided the difference in costs between the functionally equivalent required Utility Work and City's desired betterment work that is not required by the Project shall be at the sole cost of City and the betterment work can be accommodated without delaying

DRAFT

UDOT's Project. The additional betterment work shall be addressed by separate supplemental agreement between the Parties.

Once a Design-Builder has been selected by UDOT, any additional betterment work request will be negotiated directly with the Design-Builder. However, it is at UDOT's sole discretion to approve the additional betterment work.

10. SUPPLEMENTAL AGREEMENTS

UDOT and City shall enter into supplemental agreements to cover Utility Work at specific Project locations. As part of each supplemental agreement, UDOT shall provide design plans and Utility Work schedules for review and approval by City prior to starting the Utility Work. A copy of the format of the proposed supplemental agreement is marked Exhibit "B" that is incorporated by reference.

UDOT shall provide City e a two-week review and approval period for any final supplemental agreement submitted to City by UDOT.

If there are changes in the scope of the Utility Work, extra Utility Work, or changes in the planned Utility Work covered by a supplemental agreement, the Parties must first agree in writing to a modification to the supplemental agreement before the Utility Work on the changes or additions begins.

11. UDOT TO NOTIFY CITY BEFORE BEGINNING UTILITY WORK

UDOT shall notify City at least two business days before beginning any Utility Work covered by any supplemental agreements hereto, to allow City time to schedule an inspector to be present during the Utility Work. Subsequent notification of when and where Utility Work will be performed will be given on a day-to-day basis.

12. CITY TO NOTIFY UDOT

City's personnel shall notify UDOT's Resident Engineer upon arriving and leaving the Project site for verification of inspecting Utility Work. City's personnel will comply with all applicable OSHA and Project safety requirements while within the Project limits.

13. INSPECTION

City shall provide on-call engineering support by the City Engineer or appropriate representative for design review, schedule coordination, or to correct or clarify issues during Utility Work, and to perform the necessary inspection on City's facilities installed by UDOT.

a. The City Engineer and/or City's inspector shall work with and through UDOT's Project Representative and shall give no orders directly to UDOT's Design-Builder unless authorized in writing to do so. UDOT will accomplish the Utility Work covered herein on City's facilities in accordance with the plans and specifications provided and/or

DRAFT

approved by City, including changes or additions to the plans and specifications, which are approved by the Parties.

b. City shall immediately notify UDOT's Project Representative and the Design-Builder Project Representative of any deficiencies in the Utility Work on City's facilities. City shall follow up with written detail to UDOT's Project Representative and the Design-Builder Project Representative of its findings within 24-hours of making its initial notification.

c. UDOT shall respond to City's concerns within 24-hours of written notification.

d. City, through its inspection of the Utility Work, will provide UDOT's Project Representative with information covering any problems or concerns City may have with acceptance of the facilities upon completion of the Utility Work.

e. Any periodic plan and specification review or construction inspection performed by UDOT arising out of the performance of the Utility Work does not relieve the City of its duty to review and inspect the Utility Work or to ensure compliance with acceptable standards.

14. DAILY RECORDKEEPING

UDOT's Resident Engineer will keep daily records of the inspection performed by City. Daily inspection records shall be in duplicate on a form to be prepared by City or UDOT. The type of form to be used shall be preapproved by UDOT's Contracts, Compliance and Certification Manager. The Parties shall sign the inspection records and retain copies of the inspection records.

15. REIMBURSEMENT

UDOT will not reimburse City for costs incurred by City personnel for design review, observation, inspection, and operation of valves performed as part of their regularly assigned duties. Should it become necessary for City to procure outside services to perform design review, observation, or inspection to accommodate UDOT's Utility Work and Project schedule, City shall notify UDOT. Upon concurrence by UDOT, a supplemental agreement for the cost of the services shall be executed at which time City may procure outside services through appropriate solicitation.

16. SUBMITTAL OF ITEMIZED BILLS

City shall submit itemized bills covering the actual costs incurred for outside services to perform design review, oversight, and inspection work covered by supplemental agreements to UDOT's Contracts and Compliance Specialist:

UDOT Contracts and Compliance Specialist
Utah Department of Transportation
PO Box 141510
SLC UT 84114-1510

Itemized bills shall include the Project and supplemental agreement numbers, supporting sheets, and a complete billing statement of all actual costs incurred, following the order of the items in the detailed estimates contained in the supplemental agreement, and be submitted to UDOT within 60 days following completion of outside services by City on the Project. Otherwise, previous payments

DRAFT

to City may be considered final, except as agreed to between the Parties in advance.

UDOT will reimburse City within 60 days after receipt of the billings, but only for items complying fully with the provisions of Utah Administrative Code R930-8. Unless the parties otherwise agree in writing that more time is needed to submit a final billing, failure on the part of City to submit final billings within six months of the completion of outside services will result in UDOT's disallowance of that portion of outside services performed by City.

17. **SALVAGED MATERIALS**

Materials from City's existing facilities which are recovered by UDOT while performing the Utility Work and not reused on the Project shall become the property of the Design-Builder unless otherwise agreed to in advance by the Parties.

18. **RIGHT TO AUDIT**

UDOT and the Federal Highway Administration shall have the right to audit all City cost records and accounts pertaining to the Project in accordance with the auditing procedure of the Federal Highway Administration and 23 C.F.R. § 645, subpart A. Should an audit disclose that City has been underpaid, UDOT shall reimburse City within 60 days of notification of audit finding in the amount of underpayment. Should an audit disclose that City has been overpaid, City shall reimburse UDOT within 60 days of notification of audit findings in the amount of the overpayment. For purpose of audit City is required to keep and maintain its records of outside services covered herein for a minimum of three years after City receives final payment from UDOT.

19. **ACCEPTANCE AND MAINTENANCE**

Upon UDOT's completion of the Utility Work of City facilities, and City's acceptance of the Utility Work, City shall own and maintain its facilities. City shall be the sole owner of the facilities upon completion of the Project unless otherwise agreed to by the Parties.

20. **ACCESS**

City acknowledges that access for maintenance and servicing of City's facilities located on the Project right-of-way requires a permit issued by UDOT to City, and that City must obtain the permit and abide by conditions thereof for policing and other controls in conformance with Utah Administrative Code R930-7.

INDEMNIFICATION

UDOT and City are both governmental entities subject to the Governmental Immunity Act. Each Party agrees to indemnify, defend, and save harmless the other from and against all claims, suits and costs, including attorneys' fees for injury or damage of any kind, arising out of its negligent acts, errors or omissions of its officers, agents, contractors or employees in the performance of this Agreement, and from and against all claims, suits, and costs, including attorneys' fees for injury or damage of any kind. Nothing in this paragraph is intended to create additional rights to third parties or to waive any of the provisions of the Governmental Immunity Act. The obligation to indemnify is

DRAFT

limited to the dollar amounts set forth in the Governmental Immunity Act, provided the Act applies to the action or omission giving rise to the protections in this paragraph. The indemnification in this paragraph shall survive the expiration or termination of this Agreement.

21. **MISCELLANEOUS**

a. Each Party agrees to undertake and perform all further acts that are reasonably necessary to carry out the intent and purpose of this Agreement at the request of the other Party.
b. This Agreement in no way creates any type of agency relationship, joint venture, or partnership between UDOT and City.
c. The failure of either Party to insist upon strict compliance of any of the terms and conditions, or failure or delay by either Party to exercise any rights or remedies provided in this Agreement, or by law, will not release either Party from any obligations arising under this Agreement.
d. This Agreement shall be deemed to be made under and shall be governed by the laws of the State of Utah in all respects. Each person signing this Agreement warrants that the person has full legal capacity, power and authority to execute this Agreement for and on behalf of the respective Party and to bind such Party. This Agreement may be executed in one or more counterparts, each of which shall be an original, with the same effect as if the signatures were made upon the same instrument. This Agreement may be delivered by facsimile or electronic mail.

CITY OF SOUTH JORDAN AESTHETIC AND LANDSCAPE BETTERMENTS

City has requested the following Betterment Work be included with the Project Utility Work:

UDOT shall include the following Aesthetics and Landscaping Betterment Work items into the Project Utility Work. UDOT shall supplement up to $100,000.00 towards Aesthetics and Landscaping Betterment Work. UDOT and City shall enter into supplemental agreements to cover Aesthetics and Landscaping Betterment Work described below. City shall be responsible for paying the actual costs greater than $100,000.00 associated with the Aesthetics and Landscaping Betterment Work items, based on the items UDOT actually installs.

Description of Aesthetics and Landscaping Betterment Work:

Element	Desired City Betterment
Railing:	1. Black vinyl coated chain-link used for chain link within Project boundaries. 2. Black powder coat all galvanized railings.
Sidewalks:	1. Replace in kind six-foot sidewalk at no betterment cost.
Lighting and Traffic Signal Poles:	1. Black powder coated signal poles, mast arms, and lights. 2. Black powder coated sign poles with decorative slip bases, and dome caps. 3. Category 1 decorative street lighting along 11400 South (bridge) matching the spacing of existing Category 1 lights within City's limits.
Park Strip, Median & Island Treatments:	1. Landscaping with sod, trees, plants, and irrigation within 11400 South remaining area at "Oval-a-Bout," north and south of the "Oval-a-bout", for remaining area that will not be constructed as part of the 11400 South roadway reconfiguration. 2. Replace in kind City landscaped park strips at no betterment costs.
Landscaping:	1. Xeriscaping with plants and Irrigation similar to I-15 and 11400 South landscaping in the vicinity of Bangerter Highway and 11400 Interchange. 2. Any existing landscaping disturbed by the Project to be replaced in kind with all existing irrigation systems reconnected.

SOUTH JORDAN CITY
SUPPLEMENTAL AGREEMENT NO. ___

Supplement to UDOT Finance No. _____

THIS SUPPLEMENTAL AGREEMENT, made and entered into this _____ day of _____, 20____, **Utah Department of Transportation**, ("UDOT"), and the **City of South Jordan**, a Municipal Corporation of the State of Utah, ("City") each as ("Party") and jointly as ("Parties").

The parties hereto entered in to a Master Utility Agreement (MUA) dated _____, UDOT Finance No. _____. All the terms of the Master Utility Agreement remain in full force and effect unless otherwise specified herein.

The Parties agree as follows:

1. UDOT will perform the following described Utility Work in accordance with the terms and conditions of the MUA:

   a. Description of Utility Work to be performed, including proposed location, described in Exhibit "A" that is incorporated by reference: (Plan Sheets Attached)

   b. The City requirements as shown in the MUA – City Requirements, are modified as follows:
      i.

   c. Anticipated duration of Utility Work:

   d. Total estimated cost of City's (100% reimbursable) outside services: (Detailed Estimate Attached)

2. UDOT will notify the City's Project Representative, Raymond Garrison, Telephone No. (801) 253-5230, email rgarrison@sjc.utah.gov at least 48 hours in advance of beginning the Utility Work covered herein, or in accordance with the specific terms of the MUA, as applicable.

BANGERTER

Project No. S-0154(12)11, Salt Lake County
4 Interchanges on Bangerter Highway
SOUTH VALLEY SEWER DISTRICT
Charge ID No. 71939 PIN 12566

25725

SOUTH VALLEY SEWER DISTRICT
MASTER UTILITY AGREEMENT

THIS MASTER UTILITY AGREEMENT, made and entered into this 19th day of July, 2016, by and between the **Utah Department of Transportation**, ("UDOT"), and **South Valley Sewer District**, a political subdivision of the State of Utah, ("District") each as ("Party") and jointly as ("Parties").

RECITALS

WHEREAS, UDOT is preparing to request proposals for and award a design-build contract for the highway project identified as Project Number S-0154(12)11, 4 Interchanges on Bangerter Highway in Salt Lake County, Utah, ("Project"); and

WHEREAS, the design-build contractor will complete the design and administer construction of the Project ("Design-Builder"); and

WHEREAS, UDOT has identified District facilities within the limits of the Project which may necessitate the relocation, protection, or adjustment of the facilities, ("Utility Work"); and

WHEREAS, the District desires for the Design-Builder to design and perform the Utility Work on the District's facilities necessitated by the Project; and

WHEREAS, the District will perform the necessary design review and inspection to accommodate the Project; and

WHEREAS, for the purpose of expediting any required Utility Work and reimbursement, the Parties are entering into this Project Master Utility Agreement with the understanding that future supplemental agreements to this Agreement will be entered into covering the Utility Work to be accomplished by UDOT at specific Project locations.

THIS AGREEMENT is made to set out the terms and conditions where under the Utility Work shall be performed.

AGREEMENT

NOW THEREFORE, the Parties agree as follows:

1. PROJECT RESPONSIBLE FOR COST

In accordance with Utah Code § 72-6-116(3)(a)(ii), UDOT is responsible for 100% of the cost of the Utility Work of District's facilities for those costs that comply with Utah Administrative Code R930-8.

2. CONTACT INFORMATION

UDOT's Project Representative is Alana Spendlove, UDOT Project Utility and Railroad Leader, telephone number (801) 887-3462, and e-mail aspendlove@utah.gov.

UDOT's Project Representative is Alana Spendlove, UDOT Project Utility and Railroad Leader, telephone number (801) 887-3462, and e-mail aspendlove@utah.gov.

UDOT's Resident Engineer for 5400 South and 7000 South interchanges is Bryan Chamberlain, telephone number (801) 887-3405, and e-mail bchamberlain@utah.gov, or their designated representative, as assigned.

UDOT's Resident Engineer for 9000 South and 11400 South interchanges is Ken Talbot, telephone number (801) 360-8750, and e-mail kentalbot@utah.gov, or their designated representative, as assigned.

UDOT's Field Representative contact person will be identified in subsequent supplemental agreements.

District's contact person is Mike Foerster, telephone number (801) 571-1166, and e-mail mikef@svsewer.com.

After awarding the Project, UDOT will provide the District with the Design Builder contact information, hereinafter referred to as "Design-Builder Project Representative".

3. AUTHORIZATION FOR DESIGN WORK

In order to facilitate coordination and obtain technical information about the District's facilities and requirements for inclusion in this Agreement and the Request for Proposals, UDOT gave the District authorization for preliminary design engineering on April 26, 2016.

4. SUBSURFACE UTILITY ENGINEERING

UDOT has performed Subsurface Utility Engineering (SUE) within the limits of the Project. Additional SUE work to determine the precise location of underground facilities at specific, critical locations on the Project will be reviewed with the District.

5. PROJECT COORDINATION

The District requested that UDOT include items of Utility Work for relocating and adjusting District's facilities in the Project.

During the development of the Project design, the District and UDOT, along with its Design-Builder, shall consult as necessary in an effort to determine if conflicts with the District's facilities can be avoided. If Utility Work for the District's facilities is required by the Project, UDOT will be responsible to identify the conflicts and to design and construct the Utility Work of the District's facilities. The District will perform the necessary design reviews prior to the start of Utility Work. UDOT's Project Representative will be responsible for coordinating with other utility companies as it relates to District's facilities.

6. UDOT TO DESIGN AND CONSTRUCT DISTRICT'S UTILITY WORK

UDOT will schedule and meet with the District to review the design and scheduling of the Utility Work for the District's facilities at specific locations on the Project to ensure maximum lead time for advance order of materials and work force scheduling.

a. UDOT will secure permits required for Utility Work of District's Utilities.
b. UDOT will supply as-constructed plans, in PDF format specified by the District, upon completion of any required Utility Work.
c. UDOT will issue a satisfactory 1 year warranty bond covering the Utility Work completed on the District's Utilities. UDOT will cause the bond to be issued by the Design Builder directly to the District.

7. DISTRICT REQUIREMENTS

UDOT will comply with the following District requirements:

a. The design and construction of the District's Utility Work shall be in accordance with the District's standards regularly followed by the District in its own work and not considered a betterment. In the event of a conflict between UDOT and District standards, the higher standard will be applied. A copy of the District's standards dated May 23, 2012 standards can be found at http://www.svsewer.com/wp-content/uploads/2012/08/Design-Standars-and-Construction-Specifications-of-SVSD-October-30-2014.pdf and are incorporated by reference.

8. REPLACEMENT RIGHT-OF-WAY

The District owns certain easements granting it the right to operate, construct and maintain its Utilities at its existing locations. To accommodate the Project, UDOT will relocate the District's existing Utilities by constructing a replacement facility that is both functionally equivalent to the existing facility and necessary for continuous operation of the District's Utilities, the Project economy, or sequence of highway construction in accordance with Utah Administrative Code R930-8. UDOT will acquire, at UDOT's sole expense, replacement right-of-way required for the Utility Work in

accordance with Utah Administrative Code R930-8. If the District's Utilities are relocated outside of UDOT's right-of-way, UDOT will obtain an easement for the District using the form provided by the District that is attached hereto as EXHIBIT "A". If the District's Utilities are relocated from a District-owned easement or fee property into UDOT's right-of-way and UDOT does not compensate the District for the easement or fee property, UDOT shall pay 100% of the costs to relocate the District's Utilities when future UDOT projects require the relocation. When the District's Utilities are relocated from a District-owned easement or fee property into UDOT's right-of-way and UDOT does not compensate the District for the easement or fee property, UDOT shall issue encroachment permits at no cost to the District in accordance with R930-7 to allow the District to operate, maintain, and replace its Utilities.

9. BETTERMENT WORK

If the District desires to include betterment work in the Project at any specific location UDOT may agree to the betterment providing the difference in costs between the functionally equivalent required Utility Work and the District's desired betterment work that is not required by the Project shall be at the sole cost of the District and the betterment work can be accommodated without delaying UDOT's Project. The betterment work will be addressed by separate supplemental agreement between UDOT and the District.

Once a Design-Builder has been selected by UDOT, any betterment work request will be negotiated directly with the Design-Builder. However, it is at UDOT's sole discretion to approve the betterment work.

10. SUPPLEMENTAL AGREEMENTS

UDOT and the District shall enter into supplemental agreements to cover Utility Work at specific Project locations. As part of the supplemental agreement, UDOT will provide design plans and Utility Work schedules for review and approval by the District prior to start of the Utility Work.

Should it become necessary for the District to schedule internal over-time inspection hours or to procure outside services to perform preliminary engineering, plan review, observation, or inspection, to accommodate UDOT's Utility Work and Project schedule, the District shall include an estimate of cost, to include in the supplemental agreement.

A copy of the format of the proposed supplemental agreement is marked EXHIBIT "B" that is incorporated by reference.

The District will require a 2 week review and approval period prior to its submission for Board approval for any final supplemental agreement submitted to the District by UDOT. District Board of Directors meets regularly on the 3rd Tuesday of each month, with the exception of holidays.

In the event there are changes in the scope of the Utility Work, extra Utility Work, or changes in the planned Utility Work covered by a supplemental agreement, a modification to the supplemental agreement approved in writing by the Parties is required prior to the start of Utility Work on the changes or additions.

11. UDOT TO NOTIFY DISTRICT BEFORE BEGINNING UTILITY WORK

UDOT shall not perform any Utility Work until the supplemental agreement for the Utility Work is signed by the District and received by UDOT. UDOT will review and approve the supplemental agreement and will issue an authorization to proceed to the District for each specific Utility Work location.

UDOT will notify the District at least 2 business days in advance of beginning any Utility Work covered by any supplemental agreement hereto, to allow the District to schedule an inspector to be present during the Utility Work.

12. DISTRICT TO PERFORM DESIGN REVIEW AND INSPECTION

District's personnel shall notify UDOT's Field Representative upon arriving and leaving the Project site for verification of inspecting Utility Work for reimbursement purposes. District's personnel will comply with all applicable OSHA and Project safety requirements while within the Project limits.

The District shall provide on-call engineering support by District's engineer or appropriate representative for design review, schedule coordination, or to correct or clarify issues during Utility Work, and to perform the necessary inspection on the District's facilities installed by UDOT.

a. The District's engineer and/or inspector shall work with and through UDOT's Project Representative and shall give no orders directly to UDOT's Design-Builder unless authorized in writing to do so. UDOT will accomplish the Utility Work covered herein on District's facilities in accordance with the plans and specifications provided and/or approved by the District, including changes or additions to the plans and specifications, which are approved by the Parties hereto.
b. The District shall immediately notify UDOT's Project Representative and the Design-Builder Project Representative of any deficiencies in the Utility Work on the District's facilities. The District shall follow up with written detail to UDOT's Project Representative and the Design-Builder Project Representative of its findings within 24-hours of making its initial notification.
c. UDOT will respond to District's concerns within 24-hours of written notification.
d. The District, through its inspection of the Utility Work, will provide UDOT's Project Representative with information covering any problems or concerns the District may have with acceptance of the facilities upon completion of the Utility Work.
e. Any periodic plan and specification review or construction inspection performed by UDOT arising out of the performance of the Utility Work does not relieve the District of its duty in the performance of the Utility Work or to ensure compliance with acceptable standards.

13. DAILY RECORDKEEPING

UDOT's Field Representative will keep daily records of the inspection performed by the District. Daily inspection records will be in duplicate on a form to be prepared by the District or UDOT. The type of form to be used shall be preapproved by UDOT's Contracts, Compliance and

Certification Manager. The inspection records shall be signed by UDOT's Field Representative, and the District or its authorized representatives. Copies of the inspection records shall be retained by the parties to this Agreement.

14. REIMBURSEMENT

The District shall notify UDOT in advance should it become necessary for the District to procure outside services to perform preliminary engineering, design review, observation, or inspection to accommodate UDOT's Utility Work and Project schedule. Upon concurrence by UDOT, the District may procure outside services through appropriate solicitation.

The District and UDOT will negotiate necessary internal over-time inspection hours during the development of each supplemental agreement. Upon execution of each supplemental agreement, the District may proceed with approved internal over-time inspection hours, and the cost will be reimbursed by UDOT. Upon completion of the Utility Work, the District must submit actual labor hours for approved internal over-time inspection hours, external service invoices, and daily records signed by all Parties for reimbursement to the District as outlined in Sections 11 and 12 above.

15. SUBMITTAL OF ITEMIZED BILLS

The District shall submit itemized bills covering the actual costs incurred for outside services to perform preliminary engineering, design review, oversight, and inspection work or for preapproved internal over-time inspection hours of the Utility Work covered by supplemental agreements to UDOT's Contracts and Compliance Specialist:

UDOT Contracts and Compliance Specialist
4501 South 2700 West
Construction Office, Box 148220
Salt Lake City, Utah 84114-8220

Itemized bills shall bear the Project and supplemental agreement numbers, supporting sheets, and a complete billing statement of all actual costs incurred, following the order of the items in the detailed estimates contained in the supplemental agreement and be submitted to UDOT within 60 days following completion of outside services or internal over-time inspection hours by the District on the Project. Otherwise, previous payments to the District may be considered final, except as agreed to between the Parties in advance.

UDOT will reimburse the District within 60 days after receipt of the billings, but only for items complying fully with the provisions of Utah Administrative Code R930-8. Failure on the part of the District to submit final billings within 6 months of the completion of outside services will result in UDOT's disallowance of that portion of outside services performed by the District.

16. SALVAGED MATERIALS

All materials from District's existing facilities which are recovered by UDOT while performing the Utility Work and not reused on this Project, except for manhole rings and covers, shall become the property of the Design-Builder unless otherwise agreed to in advance by the Parties hereto.

17. RIGHT TO AUDIT

UDOT and the Federal Highway Administration shall have the right to audit all cost records and accounts of the District pertaining to this Project in accordance with the auditing procedure of the Federal Highway Administration and 23 C.F.R. § 645, subpart A. Should this audit disclose that the District has been underpaid, the District will be reimbursed by UDOT within 60 days upon submission of additional billing to cover the underpayment. Should this audit disclose that the District has been overpaid, the District will reimburse UDOT within 60 days of notification of audit findings in the amount of the overpayment. For purpose of audit the District is required to keep and maintain its records of outsides services covered herein for a minimum of 3 years after final payment is received by the District from UDOT.

18. ACCEPTANCE AND MAINTENANCE

UDOT will provide notification to the District for acceptance of the Utility Work upon completion of the final inspection of the District's facilities. The District will have 60 days to respond in writing to UDOT with any additional comments in regards to the Utility Work. In the event that UDOT does not receive a written response within 60 days, UDOT will designate the Utility Work accepted by the District, subject to any outstanding warranties or warranty issue.

The District will accept, own, and maintain its own facilities. The District shall be the sole owner of the facilities upon completion of the Project unless otherwise agreed to by the Parties in writing. To the extent it may lawfully do so, District further agrees to relieve UDOT from any responsibility or liability that may result from its new facilities or the operation thereof, except for any repairs necessary under any applicable warranties.

19. ACCESS

It is understood that access for maintenance and servicing of District's facilities located on the right-of-way of the Project will be allowed only by permit issued by UDOT to the District, and that the District will obtain the permit and abide by conditions thereof for policing and other controls in conformance with Utah Administrative Code R930-7.

20. INDEMNIFICATION

UDOT and the District are both governmental entities subject to the Governmental Immunity Act. Each Party agrees to indemnify, defend, and save harmless the other from and against all claims, suits and costs, including attorneys' fees for injury or damage of any kind, arising out of its negligent acts, errors or omissions of its officers, agents, contractors or employees in the performance of this Agreement, and from and against all claims, suits, and costs, including attorneys' fees for injury or damage of any kind. Nothing in this paragraph is intended to create additional rights

to third parties or to waive any of the provisions of the Governmental Immunity Act. The obligation to indemnify is limited to the dollar amounts set forth in the Governmental Immunity Act, provided the Act applies to the action or omission giving rise to the protections in this paragraph. The indemnification in this paragraph shall survive the expiration or termination of this Agreement.

21. **MISCELLANEOUS**

a. Each Party agrees to undertake and perform all further acts that are reasonably necessary to carry out the intent and purpose of this Agreement at the request of the other Party.

b. This Agreement in no way creates any type of agency relationship, joint venture, or partnership between UDOT and District.

c. The failure of either Party to insist upon strict compliance of any of the terms and conditions, or failure or delay by either Party to exercise any rights or remedies provided in this Agreement, or by law, will not release either Party from any obligations arising under this Agreement.

d. This Agreement shall be deemed to be made under and shall be governed by the laws of the State of Utah in all respects. Each person signing this Agreement warrants that the person has full legal capacity, power and authority to execute this Agreement for and on behalf of the respective Party and to bind such Party. This Agreement may be executed in one or more counterparts, each of which shall be an original, with the same effect as if the signatures were made upon the same instrument. This Agreement may be delivered by facsimile or electronic mail.

e. If any portion of this Agreement is held to be invalid or unenforceable for any reason by a court of competent jurisdiction, such invalidity or unenforceability shall not affect any other provision hereof, and this Agreement shall be construed as if such invalid or unenforceable provision had never been contained herein.

PARCEL I.D.# _____
GRANTOR: _____

EASEMENT

A twenty (20) foot wide sanitary sewer easement located in the _____ Quarter of Section _____, Township _____, Range _____, Salt Lake Base and Meridian, U.S. Survey.

For the sum of One Dollar ($1.00) and other good and valuable consideration, the receipt and sufficiency of which is hereby acknowledged, the undersigned as GRANTORS hereby grant, convey, sell, and set over unto South Valley Sewer District, a body politic of the State of Utah, hereinafter referred to as GRANTEE, its successors and assigns, a perpetual right-of-way and easement to construct, maintain, operate, repair, inspect, protect, install, remove and replace sewer pipelines, valves, valve boxes and other sewer transmission and distribution structures and facilities, hereinafter called the FACILITIES, said right-of-way and easement, being situate in Salt Lake County, State of Utah, over and through a parcel of the GRANTORS' land lying within a strip twenty (20) feet wide, said strip extending ten (10) feet on each side of and lying parallel and adjacent to a line of reference and projection thereof, more particularly described as follows:

Contains: _____ acres (approx. _____l.f.)

TO HAVE AND HOLD the same unto the GRANTEE, its successors and assigns, with the right of ingress and egress in the GRANTEE, its officers, employees, agents and assigns to enter upon the above-described property with such equipment as is necessary to construct, install, maintain, operate, repair, inspect, protect, remove and replace the FACILITIES. During construction periods, GRANTEE and its contractors may use such portion of GRANTORS' property along and adjacent to the right-of-way and easement as may be reasonably necessary in connection with the construction or repair of the FACILITIES. The contractor performing the work shall restore all property, through which the work traverses, to as near its original condition as is reasonably possible. GRANTORS shall have the right to use the above-described property except for the purposes for which this right-of-way and easement is granted to the GRANTEE, provided such use shall not interfere with the FACILITIES or with the discharge and conveyance of sewage through the FACILITIES, or any other rights granted to the GRANTEE hereunder.

GRANTORS shall not build or construct, or permit to be built or constructed, any building or other improvement over or across this right-of-way and easement nor change the contour thereof without the written consent of GRANTEE. This right-of-way and easement grant shall be binding upon, and inure to the benefit of, the successors and assigns of the GRANTORS and the successors and assigns of the GRANTEE, and may be assigned in whole or in part by GRANTEE.

IN WITNESS WHEREOF, the GRANTORS have executed this right-of-way and Easement this _____ day of _____, _____.

SOUTH VALLEY SEWER DISTRICT
SUPPLEMENTAL AGREEMENT NO. ___

Supplement to UDOT Finance No. _____

THIS SUPPLEMENTAL AGREEMENT, made and entered into this _____ day of _____, 20____, **Utah Department of Transportation**, ("UDOT"), and **South Valley Sewer District**, a political subdivision of the State of Utah, ("District") each as ("Party") and jointly as ("Parties").

The parties hereto entered in to a Master Utility Agreement (MUA) dated _____, UDOT Finance No. _____. All the terms of the Master Utility Agreement remain in full force and effect unless otherwise specified herein.

The Parties agree as follows:

1. UDOT will perform the following described Utility Work in accordance with the terms and conditions of the MUA:

   a. Description of Utility Work to be performed, including proposed location, described in Exhibit "A" that is incorporated by reference: (Plan Sheets Attached)

   b. The City/District requirements as shown in the MUA – District Requirements, are modified as follows:
      i.

   c. Anticipated duration of Utility Work:

   d. Total estimated cost of City/District's (100% reimbursable) outside services: (Detailed Estimate Attached)

2. UDOT will notify the District's Project Representative, Mike Foerster, telephone No. (801) 571-1166, email mikef@svsewer.com at least 48 hours in advance of beginning the Utility Work covered herein, or in accordance with the specific terms of the MUA, as applicable.

IN WITNESS WHEREOF, the Parties hereto have caused these presents to be executed by their duly authorized officers as of the day and year first written above.

TELECOMMUNICATIONS FACILITY EXCHANGE AGREEMENT BETWEEN SYRINGA NETWORKS, LLC. AND THE UTAH DEPARTMENT OF TRANSPORTATION, STATE OF UTAH

THIS TELECOMMUNICATIONS FACILITY EXCHANGE AGREEMENT (hereinafter referred to as the "Agreement") is made and entered into as of the 28 day of July, 2010 (the "Effective Date"), between **SYRINGA Networks, LLC**, an Idaho limited liability company, with primary offices at 3795 S. Development Ave., Boise, ID 83705 ("SYRINGA"), and **Utah Department of Transportation, State of Utah**, located at 4501 S. 2700 W., Salt Lake City, UT 84119 ("UDOT") (hereafter referred to individually as "Party", and collectively as "Parties").

WHEREAS, each Party owns or will own telecommunication facilities within the State of Utah; and

WHEREAS, each Party owns (or will construct and own) or has (or will have upon completion of construction) ownership rights in a Conduit System and/or a Fiber System and each Party wishes to exchange the right to use certain conduit or fiber on their respective Conduit System or Fiber System for the right to use certain conduit or fiber on the other Party's Conduit System or Fiber System, and

WHEREAS, Sections 72-7-108 and 72-7-109, Utah Code Annotated, specifically authorize UDOT to enter into telecommunication facility exchange agreements with other third party telecommunication providers;

NOW, THEREFORE, for and in consideration of the mutual covenants and consideration set forth in this Agreement, the Parties do hereby agree as follows:

1. **Definitions.** The following terms, whether in the singular or in the plural, when used in this Agreement and initially capitalized, shall have the meaning specified:

   1.1 Authorizations: All governmental or municipal approvals and authorizations; all rights-of-way; and all leases, licenses, consents or other agreements necessary for the Licensor to construct, install, maintain and repair its Conduit System.

   1.2 Conduit System: A reference to a Party's conduit and associated Telecommunication Facilities.

   1.3 SYRINGA Conduit System: The Conduit System owned by SYRINGA, including the conduit to be installed as identified in Exhibit B. UDOT will be authorized to use two (2) tubes in the Conduit System as identified in Exhibit B. SYRINGA's Conduit System shall be built in conformity with UDOT's written standards and specifications entitled UDOT Standards and Specifications 2008 Edition including the 2008 Supplemental Specifications, as of the last edit on November 18, 2009. Said UDOT Standards and Specifications are incorporated herein by reference.

   1.4 Telecommunications Advisory Council: Telecommunications Advisory Council means the advisory council created pursuant to Utah Code--Title72—Chapter 07-- Section-109--Protection of Highways Act.

1.5 License: Authorization to use the Licensed Conduit for the License Term, subject to the terms and conditions of this Agreement.

1.6 License Term: The period of time for which each License is effective, as further defined in paragraph 7 of this Agreement.

1.7 Licensed Conduit: A specific portion of conduit, which is part of either the SYRINGA Conduit System or the UDOT. Conduit System, for which use of such conduit has been authorized by the owner of the Conduit System. The Licensed Conduit includes reasonable access and use of related Telecommunication Facilities necessary for the use of the Licensed Conduit.

1.8 Licensee: The Party (either UDOT or SYRINGA as the context requires) authorized to use Licensed Conduit within the other Party's Conduit System.

1.9 Licensor: SYRINGA as respects the SYRINGA Conduit System and UDOT as respects the UDOT Conduit System.

1.10 Telecommunication Facility(ies): All physical plant and data components of each party.

1.11 UDOT Conduit System: The unused portion of the Conduit System owned by UDOT, and available for use by SYRINGA, as more particularly identified on Exhibit B; provided that such Conduit System may be modified from time-to-time at UDOT's sole discretion and secured with an update to the UDOT/SYRINGA balance sheet .

1.12 UDOT Right-of-Way: UDOT Right-of-Way on any interstate or state road that UDOT has the legal right to use and manage

2. Obligations of SYRINGA. SYRINGA shall:

2.1 Construct, at its own cost and expense, the SYRINGA Conduit System identified and described in Exhibit B (hereinafter the "Planned Conduit").

2.2 Grant to UDOT, upon completion of the Planned Conduit, without further charge or fee or consideration, a License to use, for the Term of this Agreement, the exclusive use of two tubes in SYRINGA's Conduit as identified in Exhibit B in accordance with the Planned Conduit plans and specifications. SYRINGA shall issue a Conduit Use Authorization to UDOT when the conduit is available for occupancy and use by UDOT.

3. Obligations of UDOT. UDOT shall immediately:

3.1 Grant SYRINGA, without further charge or fee or consideration, a License to use, for the Term of this Agreement, the exclusive use of one tube in UDOT's Conduit System as identified in Exhibit B.

3.2 Grant SYRINGA non-exclusive access to the UDOT Right-of-Way throughout the term of this Agreement. In using said access, SYRINGA agrees to follow Utah Admin. Code R930-6 entitled Manual of Accommodation of Utility Facilities and the Control and Protection of State Highway Rights-of-Way, and Utah Admin. Code R907-1 entitled Appeal of Departmental Actions. SYRINGA may use said access for any lawful purpose without interference from UDOT or any third party.

4. Restrictions on Use.

4.1 This Agreement and each License is subject to the terms and conditions of the applicable Authorizations. Each License is for the use of the Licensed Conduit only. The Licensed Conduit will remain the sole and exclusive property of Licensor, and nothing contained

herein will give or convey to Licensee any property right, title or interest whatever in such Licensed Conduit, which will at all times be and remain Licensor's personal property **notwithstanding that** it may be or become attached to or embedded in realty. Licensee hereby grants to Licensor the right to recover all components of the Licensed Conduit from Licensee's premises upon expiration or earlier termination of this Agreement or any License.

4.2 Licensee may use the Licensed Conduit for its own business purposes. Licensor acknowledges that it has no right to use the Licensed Conduit during the applicable License Term.

4.3 Licensor shall not use its Conduit System in a way which interferes with or adversely affects the use of the Licensed Conduit by Licensee. Licensee shall not use the Licensed Conduit in a way which interferes with or adversely affects the use of Licensor's Conduit System.

5. Access and Escort.

5.1 Licensor shall provide Licensee access to the Licensed Conduit. It is the responsibility of Licensee to obtain any related governmental or other authority necessary to access and use the Licensed Conduit not available from Licensor.

5.2 Licensee shall be responsible for all cable locate services for the Licensed Conduit. All costs associated with Licensee's access to the Licensed Conduit will be borne by the Licensee.

6. Repair, Maintenance, and Continuity.

6.1 Licensor shall dispatch maintenance and repair personnel as soon as practical along the Conduit System to handle and repair problems detected by the Licensee that existed prior to the Effective Date.

a. UDOT shall coordinate all maintenance and repair activities with **SYRINGA's Network Operations Center at 1-800-454-7214.**

b. SYRINGA shall coordinate all maintenance and repair activities with UODT and follow the Utah Admin. Code R930-6 entitled Manual of Accommodation of Utility Facilities and the Control and Protection of State Highway Rights-of-Way. UDOT Permit fees for SYRINGA are waived for work with in the UDOT Right-of-Way. SYRINGA must follow all permitting processes according to the area that they are working in.

6.2 Maintenance.

a. From time to time, at the Licensor's reasonable discretion, and after adequate advance notice to the Licensee (which shall be at least ten (10) business days), the Licensor will schedule and perform specific periodic maintenance and repair checks and services on the Licensed Conduit. Licensee shall not be responsible for the repair or costs of repair for any defects in the Licensor conduit that existed prior to the Effective Date.

b. Non-emergency work that is reasonably expected to result in signal discontinuity must be coordinated between the Parties, and performed in accordance with Scheduled Maintenance Procedures. "Scheduled Maintenance Procedures" or "SMP" means a pre-arranged period of time reserved for performing certain work on Licensor's Fiber System that may impact communication services. Generally, SMP will be restricted to a Saturday or Sunday after midnight and before 6:00 a.m., local time. Major Fiber System work such as fiber rolls and hot cuts will also be scheduled utilizing SMP.

6.3 Emergency Maintenance. The Parties acknowledge that the transports on the Telecommunication Facilities are time sensitive. Each Party agrees to cooperate to bring the Telecommunication Facilities back to working order as quickly as possible.

6.4 The Licensor may hire a contractor to perform its maintenance and repair obligations.

6.5 The Licensee shall have the right, but not the obligation, to supervise and oversee any work performed by the Licensor in or to the Licensee's facilities, at Licensee's cost.

6.6 All of the Licensor's obligations under this Section shall be at the Licensor's sole cost and expense, subject to Section 13.

7. **Term.** The term of this Agreement, shall begin on the Effective Date, and shall terminate thirty (30) years later, or after either Party gives the other Party notice that it intends to terminate this agreement. ("Term"). After the initial thirty (30) year term, this Agreement shall renew automatically on its anniversary date for two (2) successive five (5) year periods, unless terminated with or without cause in writing by either Party. Upon termination of the agreement either Party will have five (5) years to arrange for removal and relocation of their telecommunication facilities.

8. **Trade-In of Occupied Conduit During Term.** Nothing in the Agreement shall preclude either party from substituting currently occupied conduit for substitute conduit at another location provided said conduit is available for use and the other party consents. The requesting party shall be solely responsible for any additional costs associate with the exchange, including any repair of the newly requested conduit or related identification and/or proofing.

9. **Express Warranty of Function-ability.**

9.1 The Parties mutually warrant that any Telecommunication Facility which either party has an obligation to furnish to the other by License or otherwise under this Agreement, shall be fully functional and fit for the intended purpose for which it was licensed.

10. **Representations Regarding Authorizations.**

10.1 Licensor represents, warrants and covenants that:

a. it has obtained, and will use commercially reasonable efforts to maintain all applicable Authorizations throughout each License Term; and

b. it has the full right and authority pursuant to the Authorizations to enter into this Agreement and perform its obligations hereunder, and will not violate the Authorizations (with or without the giving of notice or the lapse of time or both) and is not required to obtain any additional consent, approval, filing or notice under the Authorizations or under any provision of any law, rule or regulation, court order, judgment or decree applicable to the Licensor; and

c. it has no knowledge of any defect in the normal operating condition of the Conduit System that would have an adverse effect on the ability of the other Party to utilize the Licensed Conduit to provide telecommunications services to its customers; and

d. it will exercise its rights and perform its obligations hereunder only in accordance with all applicable laws, rules and regulations; and

e. it will perform all maintenance services in a professional and workmanlike manner in accordance with industry standards.

10.2 Licensee represents, warrants and covenants that:

a. Licensee's use of the Licensed Conduit will be limited to the provision of communication services in accordance with all Federal, State and local laws, rules, regulations, codes, statutes and subject to all Authorizations; and

b. Licensee has obtained all rights of way, authorizations and consents necessary to use the Licensed Conduit. Licensee will indemnify, defend and hold harmless Licensor from any claims related to its use of the Licensed Conduit; and

c. it has the full right and authority under the Authorizations to enter into this Agreement and perform its obligations hereunder, and the same will not violate the Authorizations (with or without the giving of notice or the lapse of time or both) and is not required to obtain any additional consent, approval, filing or notice under the Authorizations or under any provision of any law, rule or regulation, court order, judgment or decree applicable to the Licensee; and

d. it will perform all work related to access and use of the Licensed Conduit in a professional and workmanlike manner in accordance with industry standards.

11. Default and Termination.

11.1 Neither Party shall be in default under this Agreement unless and until such Party has received written notice of such default from the other Party, and has failed to cure the default within thirty (30) days after receipt of such notice, except for a payment default which must be cured within ten (10) days after receipt of such notice. Notwithstanding, when a default (unrelated to payment) cannot reasonably be cured within such thirty (30) day period, the time for curing such default shall be extended for a period no longer than ninety (90) days from the date of the receipt of the default notice if the Party proceeds promptly to cure the default with due diligence.

11.2 Unless otherwise provided herein, a Party shall be in default if (i) such Party breaches any term or provision of this Agreement or fails to comply with the provisions of this

License; (ii) such Party becomes insolvent; (iii) a petition under any of the bankruptcy laws is filed by or against such Party; (iv) such Party makes a general assignment for the benefit of creditors; or (v) a receiver, whether temporary or permanent, is appointed for the property of such Party or any part thereof.

11.3 Upon the failure by the defaulting Party to timely cure any default, the non-defaulting Party may (i) take such action as it determines, in its sole discretion, to be necessary to correct the default, and/or (ii) pursue any legal remedies it may have under applicable law or principles of equity relating to such breach. Notwithstanding the above, if the defaulting Party certifies to the non-defaulting Party in writing that a default has been cured, such default shall be deemed to be cured unless the non-defaulting Party notifies the defaulting Party in writing within fifteen (15) days of receipt of the defaulting Party's notice of cure.

12. Taxes.

12.1 Each Party shall be responsible for and shall timely pay any and all taxes and franchise, license and permit fees (hereinafter collectively referred to as "Taxes") based on the physical location or construction of its own Conduit System or otherwise assessed, levied or charged against such Conduit System.

12.2 If either Party wishes to contest any Taxes imposed on or assessed against it, it shall have the right to protest, by appropriate proceedings, the imposition or assessment of any such Taxes and the other Party shall provide reasonable cooperation at the challenging Party's cost, provided that the challenging Party shall indemnify and hold the other Party harmless from any expense, legal action or cost, including reasonable attorney's fees, resulting from the exercise of its rights under this paragraph. The challenging Party shall be entitled to any refund, rebate, reduction or abatement resulting from its challenge.

13. Relocation of the Facilities.

13.1 UDOT and SYRINGA, as Licensee, recognize that from time to time the Licensor may elect or be required to relocate the Conduit System, or a portion thereof. SYRINGA will relocate their facilities on UDOT Right-of-Way according to their Statewide Utility License Agreement with UDOT. UDOT will relocate any facilities on SYRINGA Right – of –Way at UDOT's expense.

14. Indemnification and Limitation of Liability.

14.1 NEITHER PARTY SHALL BE LIABLE TO THE OTHER FOR ANY INDIRECT, SPECIAL, PUNITIVE OR CONSEQUENTIAL DAMAGES (INCLUDING BUT NOT LIMITED TO, ANY DAMAGES ARISING OUT OF ANY CLAIM FROM ANY CUSTOMER FOR LOSS OF SERVICES) ARISING UNDER THIS AGREEMENT OR FROM ANY BREACH OF THIS AGREEMENT, OR ARISING OUT OF ANY ACT OR OMISSION OF EITHER PARTY HERETO, ITS EMPLOYEES, SERVANTS, CONTRACTORS AND/OR AGENTS.

14.2 Each Party shall indemnify, defend and hold the other harmless from and against any and all liabilities, losses, costs and expenses, including reasonable attorneys' fees, which are based upon or arise out of its acts or omissions, and the acts or omissions of its employees, agents or contractors. In no event will either Party indemnify the other Party

against claims brought by an employee against their employing Party. Nothing in this paragraph is intended to create additional rights to third parties or to waive any of the provisions of the Governmental Immunity Act. The obligation of UDOT to indemnify is limited to the dollar amounts set forth in the Governmental Immunity Act, provided said Act applies to the action or omission giving rise to the protections in this paragraph.

14.3 When a Party has actual knowledge of a claim falling within the other Party's indemnification obligations, such Party shall promptly so notify the other Party and provide reasonable assistance and information appropriate to the defense of the claim(s). In no event shall the Party against whom the claim is asserted have the right to pay, settle or compromise such claim without the prior written consent of the Party who may be obligated for such indemnity. The Parties agree that they will not unreasonably withhold their consent to any such payment, settlement or compromise.

Nothing contained herein shall operate as a limitation on the right of either Party to bring an action for damages, including consequential damages, against any third party (i.e., any person other than U.D.O.T., SYRINGA, and their respective officers, directors, agents and partners) based on any acts or omissions of such third party as such acts or omissions may affect the construction, operation or use of the Licensed Conduit.

15. Insurance.

15.1 During the Agreement Term, the Parties shall maintain not less than the following insurance:

Type of Coverage	Amount of Coverage
Worker's Compensation Insurance	Statutory Amount
Employer's Liability Occupational Disease and Bodily Injury Insurance	$1 million each accident $1 million disease each employee $1 million disease-policy limit
Commercial General Liability Insurance, including premises-operations, products/completed operations, independent contractors, contractual (blanket), broad form property damage, with umbrella excess liability (collectively, "Comprehensive Coverage")	Combined single limit personal injury and property damage on an occurrence policy form with policy amounts of (i) not less than $5 million per occurrence (without a limitation on aggregate amount); or (ii) not less than $5 million per occurrence with an aggregate annual amount of not less than $5 million
Automobile Liability Insurance for owned, hired and non-owned autos	$2 million combined single limit bodily injury/property damage

15.2 The comprehensive general liability policies and umbrella excess liability policies of each Party shall contain a provision naming the other Party, its parent, subsidiaries and affiliates, and each of its respective officers, directors, employees as Additional Insured.

15.3 Prior to commencement of any work pursuant to this Agreement, each Party must furnish to the other Party applicable certificates of insurance identifying the certificate holder as Additional Insured in accordance with subsection (15.2), and stating that the insurer will endeavor to notify Licensor at least 30 days prior to cancellation of, or any material change in, the coverage provided.

15.4 The foregoing insurance requirements are not intended to and shall not in any manner limit or qualify the liabilities and obligations assumed by U.D.O.T. or SYRINGA under this Agreement.

16. Force Majeure. Neither Party shall be liable to the other for any failure or delay of performance under this Agreement due to causes beyond its reasonable control (collectively, "Force Majeure Events").

17. Assignment. Except as provided below, neither Party may assign or otherwise transfer this Agreement or its rights or obligations hereunder without the prior written consent of the other Party, which consent will not be unreasonably withheld, conditioned or delayed. Notwithstanding the foregoing, both Parties shall have the right, without the other Party's consent, to assign or otherwise transfer this Agreement as collateral to any lender or to any parent or any corporation which purchases all or substantially all of its assets; provided, however, that any such assignment or transfer shall be subject to the terms and conditions of this Agreement and any assignee or transferee shall continue to perform the assigning Party's obligations pursuant to the terms and conditions of this Agreement.

18. Notice.

18.1 To be effective, notice must be in writing and delivered by pre-paid commercial overnight delivery service, or by first class mail, return receipt requested, addressed as follows:

If to SYRINGA:
SYRINGA Networks, LLC
Attn: Greg Lowe, CEO
3795 S. Development Ave.
Boise, ID 83705

If to U.D.O.T.:
U.D.O.T.
ATTN: Lynne Yocom
2060 S. 2760 W.
Salt Lake City, UT 84104

18.2 Either Party may change its notice address(es) by written notice to the other Party.

18.3 Notice shall be effective on the date of the addressee's receipt or refusal, as the case may be.

19. Dispute Resolution. Except as otherwise specifically provided in or permitted by this Agreement, all disputes, differences of opinion or controversies arising in connection with this

Agreement shall first be resolved through good faith negotiation to arrive at an agreeable resolution. If, after negotiating in good faith for a period of ninety (90) calendar days, or any agreed further period, the Parties are unable to resolve the dispute, then the Parties may seek resolution by mediation. Parties may meet together to resolve the controversy, claim, or breach or they may select a mutually acceptable mediator to do so. Parties shall bear their respective costs incurred in mediation.

20. Miscellaneous.

20.1 The relationship between the Parties shall not be that of partners, agents or joint ventures for one another, and nothing contained in this Agreement shall be deemed to constitute a partnership or agency agreement between them for any purposes, including, but not limited to federal income tax purposes. In performing any of their obligations hereunder, the Parties shall be independent contractors or independent Parties and shall discharge their contractual obligations at their own risk.

20.2 This Agreement shall be interpreted and enforced under the laws of the State of Utah without regard to its conflicts of law provisions.

20.3 If any provision of this Agreement is unenforceable, it shall be deemed stricken from this Agreement and shall have no effect on any other provision.

20.4 This Agreement shall be binding upon and inure to the benefit of Parties and their respective representatives, successors and assigns.

20.5 No waiver shall be valid unless in writing and signed by the Party against whom enforcement is sought. No waiver of any breach or obligation shall constitute a waiver of any subsequent breach or obligation.

21. ACCESS TO INTERSTATE RIGHT-OF-WAY

21.1 SYRINGA's Planned Conduit may occupy UDOT's Right-of-Way along various interstates. The value of the Right-of-Way has been assessed according to UDOT's 2004 Summary of Segment Values attached herein as Exhibit A. No additional Right-of-Way fees shall be assessed during the Term of this Agreement.

22. Entire Agreement.

22.1 This Agreement, including all Exhibits referred to herein, sets forth the entire agreement of the Parties with respect to the subject matter hereof and supersedes all prior understandings and agreements all prior or contemporaneous agreements, representations, statements, negotiations, and undertakings written or oral. The following Exhibits are attached to and incorporated into this Agreement:

EXHIBIT A: SUMMARY OF SEGMENT VALUES

EXHIBIT B: MAPS OF UDOT CONDUIT SYSTEM and SYRINGA CONDUIT SYSTEM (INCLUDING PLANNED CONSTRUCTION)

EXHIBIT C: UDOT/SYRINGA BALANCE SHEET

22.2 This Agreement and any of the provisions hereof may not be amended, altered or added to in any manner except by a written document signed by an authorized representative of each Party.

IN WITNESS WHEREOF, the Parties have caused this Conduit Exchange Agreement to be executed by their respective duly authorized representatives as of the day and year first above written.

TAYLORSVILLE CITY
MASTER UTILITY AGREEMENT

THIS MASTER UTILITY AGREEMENT, made and entered into this _____day of_____, 20_____, by and between the **Utah Department of Transportation**, ("UDOT"), and **Taylorsville City**, a Municipal Corporation of the State of Utah, ("City") each as ("Party") and jointly as ("Parties").

RECITALS

WHEREAS, UDOT is preparing to request proposals for and award a design-build contract for the highway project identified as Project Number S-0154(12)11, 4 Interchanges on Bangerter Highway in Salt Lake County, Utah, ("Project"); and

WHEREAS, the design-build contractor will complete the design and administer construction of the Project ("Design-Builder"); and

WHEREAS, UDOT has identified City facilities within the limits of the Project which may necessitate the relocation, protection, or adjustment of the facilities, ("Utility Work"); and

WHEREAS, the City desires for the Design-Builder to design and perform the Utility Work on the City's facilities necessitated by the Project; and

WHEREAS, the City will perform the necessary design review and inspection to accommodate the Project; and

WHEREAS, for the purpose of expediting any required Utility Work and reimbursement, the Parties are entering into this Project Master Utility Agreement with the understanding that future supplemental agreements to this Agreement will be entered into covering the Utility Work to be accomplished by UDOT at specific Project locations.

THIS AGREEMENT is made to set out the terms and conditions where under the Utility Work shall be performed.

DRAFT

AGREEMENT

NOW THEREFORE, the Parties agree as follows:

1. PROJECT RESPONSIBLE FOR COST

In accordance with Utah Code § 72-6-116(3)(a)(ii), UDOT is responsible for 100% of the cost of the Utility Work of City's facilities for those costs that comply with Utah Administrative Code R930-8.

2. CONTACT INFORMATION

UDOT's Project Representative is Alana Spendlove, UDOT Project Utility and Railroad Leader, telephone number (801) 887-3462, and e-mail aspendlove@utah.gov.

UDOT's Resident Engineer for 5400 South and 7000 South interchanges is Bryan Chamberlain, telephone number (801) 887-3405, and e-mail bchamberlain@utah.gov, or their designated representative, as assigned.

UDOT's Resident Engineer for 9000 South and 11400 South interchanges is Ken Talbot, telephone number (801) 360-8750, and e-mail kentalbot@utah.gov, or their designated representative, as assigned.

UDOT's Field Representative contact person will be identified in subsequent supplemental agreements.

City's contact person is Wayne Harper, telephone number (801) 647-8701, and e-mail wharper@taylorsvilleut.gov.

After awarding the Project, UDOT will provide the City with the Design Builder contact information, hereinafter referred to as "Design-Builder Project Representative".

3. AUTHORIZATION FOR DESIGN WORK

In order to facilitate coordination and obtain technical information about the City's facilities and requirements for inclusion in this Agreement and the Request for Proposals, UDOT gave the City authorization for preliminary design engineering on July 27, 2016.

4. SUBSURFACE UTILITY ENGINEERING

UDOT has performed Subsurface Utility Engineering (SUE) within the limits of the Project. Additional SUE work to determine the precise location of underground facilities at specific, critical locations on the Project will be reviewed with the City.

DRAFT

5. PROJECT COORDINATION

The City requested that UDOT include items of Utility Work for relocating and adjusting City's facilities in the Project.

During the development of the Project design, the City and UDOT, along with its Design-Builder, shall consult as necessary in an effort to determine if conflicts with the City's facilities can be avoided. If Utility Work for the City's facilities is required by the Project, UDOT will be responsible to identify the conflicts and to design and construct the Utility Work of the City's facilities. The City will perform the necessary design reviews prior to the start of Utility Work. UDOT's Project Representative will be responsible for coordinating with other utility companies as it relates to City's facilities.

6. CITY REQUIREMENTS

UDOT will comply with the following City Utility Work requirements**:**

a. The City will require …
b. In general, the City cannot have …
c. UDOT will supply as-constructed plans, in _____ format, upon completion of any required Utility Work.

7. UDOT TO DESIGN AND CONSTRUCT CITY'S UTILITY WORK

UDOT will schedule and meet with the City to review the design and scheduling of the Utility Work for the City's facilities at specific locations on the Project to ensure maximum lead time for advance order of materials and work force scheduling.

a. UDOT will design the Utility Work in accordance with City's standards regularly followed by the City in its own work and not considered a betterment. In the event of a conflict between UDOT and City standards, the higher standard will be applied. A copy of the City's standards can be found at _____that is incorporated by reference.
a. UDOT will secure permits required for Utility Work of City's facilities.

8. RIGHT-OF-WAY

Any easements or replacement right-of-way required in conjunction with the Utility Work of City's facilities will be acquired by UDOT in accordance with the requirements of Utah Administrative Code R930-8.

9. BETTERMENT WORK

City Aesthetics and Landscaping Betterment Work is described in attached Exhibit "A" that is incorporated by reference.

DRAFT

If the City desires to include additional betterment work in the Project at any specific location UDOT may agree to the betterment providing the difference in costs between the functionally equivalent required Utility Work and the City's desired betterment work that is not required by the Project shall be at the sole cost of the City and the betterment work can be accommodated without delaying UDOT's Project. The betterment work will be addressed by separate supplemental agreement between UDOT and the City.

Once a Design-Builder has been selected by UDOT, any betterment work request will be negotiated directly with the Design-Builder. However, it is at UDOT's sole discretion to approve the betterment work.

10. SUPPLEMENTAL AGREEMENTS

UDOT and the City shall enter into supplemental agreements to cover Utility Work at specific Project locations. As part of the supplemental agreement, UDOT will provide design plans and Utility Work schedules for review and approval by the City prior to start of the Utility Work. A copy of the format of the proposed supplemental agreement is marked EXHIBIT "A" that is incorporated by reference.

The City will require a 2 week review and approval period for any final supplemental agreement submitted to the City by UDOT. The City does not require council review for supplemental agreement approval.

In the event there are changes in the scope of the Utility Work, extra Utility Work, or changes in the planned Utility Work covered by a supplemental agreement, a modification to the supplemental agreement approved in writing by the Parties is required prior to the start of Utility Work on the changes or additions.

11. UDOT TO NOTIFY CITY BEFORE BEGINNING UTILITY WORK

UDOT will notify the City at least 2 business days in advance of beginning any Utility Work covered by any supplemental agreements hereto, to allow the City time to schedule an inspector to be present during the Utility Work. Subsequent notification of when and where Utility Work will be performed will be given on a day-to-day basis.

12. CITY TO NOTIFY UDOT

City's personnel shall notify UDOT's Resident Engineer upon arriving and leaving the Project site for verification of inspecting Utility Work. City's personnel will comply with all applicable OSHA and Project safety requirements while within the Project limits.

13. INSPECTION

The City shall provide on-call engineering support by City's engineer or appropriate representative for design review, schedule coordination, or to correct or clarify issues during Utility Work, and to perform the necessary inspection on the City's facilities installed by UDOT.

DRAFT

a. The City's engineer and/or inspector shall work with and through UDOT's Project Representative and shall give no orders directly to UDOT's Design-Builder unless authorized in writing to do so. UDOT will accomplish the Utility Work covered herein on City's facilities in accordance with the plans and specifications provided and/or approved by the City, including changes or additions to the plans and specifications, which are approved by the Parties hereto.
b. The City shall immediately notify UDOT's Project Representative and the Design-Builder Project Representative of any deficiencies in the Utility Work on the City's facilities. The City shall follow up with written detail to UDOT's Project Representative and the Design-Builder Project Representative of its findings within 24-hours of making its initial notification.
c. UDOT will respond to City's concerns within 24-hours of written notification.
d. The City, through its inspection of the Utility Work, will provide UDOT's Project Representative with information covering any problems or concerns the City may have with acceptance of the facilities upon completion of the Utility Work.
e. Any periodic plan and specification review or construction inspection performed by UDOT arising out of the performance of the Utility Work does not relieve the City of its duty in the performance of the Utility Work or to ensure compliance with acceptable standards.

14. DAILY RECORDKEEPING

UDOT's Resident Engineer will keep daily records of the inspection performed by the City. Daily inspection records will be in duplicate on a form to be prepared by the City or UDOT. The type of form to be used shall be preapproved by UDOT's Contracts, Compliance and Certification Manager. The inspection records shall be signed by UDOT's Field Representative, and the City or its authorized representatives. Copies of the inspection records shall be retained by the parties to this Agreement.

15. REIMBURSEMENT

UDOT will not reimburse the City for costs incurred by City personnel for design review, observation, inspection, and operation of valves performed as part of their regularly assigned duties. Should it become necessary for the City to procure outside services to perform design review, observation, or inspection to accommodate UDOT's Utility Work and Project schedule, the City shall notify UDOT. Upon concurrence by UDOT, a supplemental agreement for the cost of the services will be executed at which time the City may procure outside services through appropriate solicitation.

16. SUBMITTAL OF ITEMIZED BILLS

The City shall submit itemized bills covering the actual costs incurred for outside services to perform design review, oversight, and inspection work covered by supplemental agreements to UDOT's Contracts and Compliance Specialist:

DRAFT

UDOT Contracts and Compliance Specialist
Utah Department of Transportation
PO Box 141510
SLC UT 84114-1510

Itemized bills shall bear the Project and supplemental agreement numbers, supporting sheets, and a complete billing statement of all actual costs incurred, following the order of the items in the detailed estimates contained in the supplemental agreement and be submitted to UDOT within 60 days following completion of outside services by the City on the Project. Otherwise, previous payments to the City may be considered final, except as agreed to between the Parties in advance.

UDOT will reimburse the City within 60 days after receipt of the billings, but only for items complying fully with the provisions of Utah Administrative Code R930-8. Failure on the part of the City to submit final billings within 6 months of the completion of outside services will result in UDOT's disallowance of that portion of outside services performed by the City.

17. **SALVAGED MATERIALS**

All materials from City's existing facilities which are recovered by UDOT while performing the Utility Work and not reused on this Project shall become the property of the Design-Builder unless otherwise agreed to in advance by the Parties hereto.

18. **RIGHT TO AUDIT**

UDOT and the Federal Highway Administration shall have the right to audit all cost records and accounts of the City pertaining to this Project in accordance with the auditing procedure of the Federal Highway Administration and 23 C.F.R. § 645, subpart A. Should this audit disclose that the City has been underpaid, the City will be reimbursed by UDOT within 60 days upon submission of additional billing to cover the underpayment. Should this audit disclose that the City has been overpaid, the City will reimburse UDOT within 60 days of notification of audit findings in the amount of the overpayment. For purpose of audit the City is required to keep and maintain its records of outsides services covered herein for a minimum of 3 years after final payment is received by the City from UDOT.

19. **ACCEPTANCE AND MAINTENANCE**

Upon completion of the Utility Work of City facilities by UDOT, the City will accept, own, and maintain its own facilities. The City shall be the sole owner of the facilities upon completion of the Project unless otherwise agreed to by the Parties. To the extent it may lawfully do so, City further agrees to relieve UDOT from any responsibility or liability that may result from its new facilities or the operation thereof.

20. **ACCESS**

It is understood that access for maintenance and servicing of City's facilities located on the right-of-way of the Project will be allowed only by permit issued by UDOT to the City, and that the

DRAFT

City will obtain the permit and abide by conditions thereof for policing and other controls in conformance with Utah Administrative Code R930-7. **INDEMNIFICATION**

UDOT and the City are both governmental entities subject to the Governmental Immunity Act. Each Party agrees to indemnify, defend, and save harmless the other from and against all claims, suits and costs, including attorneys' fees for injury or damage of any kind, arising out of its negligent acts, errors or omissions of its officers, agents, contractors or employees in the performance of this Agreement, and from and against all claims, suits, and costs, including attorneys' fees for injury or damage of any kind. Nothing in this paragraph is intended to create additional rights to third parties or to waive any of the provisions of the Governmental Immunity Act. The obligation to indemnify is limited to the dollar amounts set forth in the Governmental Immunity Act, provided the Act applies to the action or omission giving rise to the protections in this paragraph. The indemnification in this paragraph shall survive the expiration or termination of this Agreement.

21. **MISCELLANEOUS**

a. Each Party agrees to undertake and perform all further acts that are reasonably necessary to carry out the intent and purpose of this Agreement at the request of the other Party.
b. This Agreement in no way creates any type of agency relationship, joint venture, or partnership between UDOT and City.
c. The failure of either Party to insist upon strict compliance of any of the terms and conditions, or failure or delay by either Party to exercise any rights or remedies provided in this Agreement, or by law, will not release either Party from any obligations arising under this Agreement.
d. This Agreement shall be deemed to be made under and shall be governed by the laws of the State of Utah in all respects. Each person signing this Agreement warrants that the person has full legal capacity, power and authority to execute this Agreement for and on behalf of the respective Party and to bind such Party. This Agreement may be executed in one or more counterparts, each of which shall be an original, with the same effect as if the signatures were made upon the same instrument. This Agreement may be delivered by facsimile or electronic mail.

DRAFT

TAYLORSVILLE CITY AESTHETIC AND LANDSCAPE BETTERMENTS

The City has requested the following Betterment Work be included with the Project Work:

UDOT will include the following Aesthetics and Landscaping Betterment Work items into the Project Work. UDOT will supplement up to $100,000.00 towards Aesthetics and Landscaping Betterment Work. UDOT and the City shall enter into supplemental agreements to cover Aesthetics and Landscaping Betterment Work described below. City will be responsible for paying the actual costs greater than $100,000.00 associated with the Aesthetics and Landscaping Betterment Work items, based on UDOT's actual quantities placed.

Description of Aesthetics and Landscaping Betterment Work:

Element	Desired City Betterment
Parapets:	Panel with "City of Taylorsville" raised lettering.
Retaining Walls:	Addition of a Taylorsville City logo plate onto the retaining wall or column.
Sidewalks:	1. Sidewalk on 5400 S to be at least 6-ft wide as part of a planned east-west trail system. 2. Include a sidewalk along the detention pond on parcel # 777 to connect Avalon Drive to 5400 S.
Lighting and Traffic Signal Poles:	Decorative street lights in project area similar to fixtures in front of city hall.
Park Strip, Median & Island Treatments:	1. Irrigation lines in sleeves under road to islands. 2. Rock mulch.
Landscaping:	Landscape areas, including detention ponds: Sprinklers and grass, with some trees. Trees should be tall growing evergreen and deciduous mix on 40' to 50' centers.

SUPPLEMENTAL AGREEMENT NO. ___

Supplement to UDOT Finance No. _____

THIS SUPPLEMENTAL AGREEMENT, made and entered into this _____ day of _____, 20____, **Utah Department of Transportation**, ("UDOT"), and **Taylorsville City,** a Municipal Corporation of the State of Utah, ("City") each as ("Party") and jointly as ("Parties").

The parties hereto entered in to a Master Utility Agreement (MUA) dated _____, UDOT Finance No. _____. All the terms of the Master Utility Agreement remain in full force and effect unless otherwise specified herein.

The Parties agree as follows:

1. UDOT will perform the following described Utility Work in accordance with the terms and conditions of the MUA:

   a. Description of Utility Work to be performed, including proposed location, described in Exhibit "A" that is incorporated by reference: (Plan Sheets Attached)

   b. The City requirements as shown in the MUA – City Requirements, are modified as follows:
      i.

   c. Anticipated duration of Utility Work:

   d. Total estimated cost of City's (100% reimbursable) outside services: (Detailed Estimate Attached)

2. UDOT will notify the City's Project Representative, City's contact person is Wayne Harper, telephone number (801) 647-8701, and e-mail wharper@taylorsvilleut.gov at least 48 hours in advance of beginning the Utility Work covered herein, or in accordance with the specific terms of the MUA, as applicable.

UNITED STATES
DEPARTMENT OF THE INTERIOR
BUREAU OF RECLAMATION

PROJECT AGREEMENT BETWEEN THE UNITED STATES OF AMERICA AND UTAH DEPARTMENT OF TRANSPORTATION AND JORDAN VALLEY WATER CONSERVANCY DISTRICT

DRAFT

THIS PROJECT AGREEMENT, made this _____day of_____ , 2016, pursuant to the Act of Congress of June 17, 1902 (32 Stat. 388), and acts amendatory thereof or supplementary thereto, all of which acts are commonly known and referred to as Reclamation Laws, and particularly pursuant to Sections 10 and 14 of the Act of August 4, 1939, (53 Stat. 1187) among the UNITED STATES OF AMERICA, represented by the officer executing this Project Agreement, his duly appointed successor, or his duly authorized representative, hereinafter referred to as the "United States", UTAH DEPARTMENT OF TRANSPORTATION hereinafter referred to as "UDOT", and JORDAN VALLEY WATER CONSERVANCY DISTRICT herein referred to as "Jordan Valley."

WITNESSETH THAT:

WHEREAS, the United States has constructed and continues to own large projects for the storage and delivery of water; and

WHEREAS, the United States has contracted with various water user organizations to operate and maintain its project facilities; and

WHEREAS, as a result, the United States holds real property interests (fee title and easements), hereinafter referred to as "Land Interests of the United States", located throughout the State of Utah which are acquired through the Bureau of Reclamation (Reclamation); and

WHEREAS, the United States owns certain project facilities located on the Land Interests of the United States, including the Jordan Aqueduct, and appurtenant structures, located in the vicinity of the SR-154, Bangerter Highway corridor, hereinafter referred to as the "US Facilities"; and

WHEREAS, the Central Utah Project Completion Act (Titles II-VI of P.L. 102-575, as amended) (CUPCA) was enacted on October 30, 1992; and

WHEREAS, Section 201(e) of the CUPCA transferred Federal oversight responsibility for all phases of the Bonneville Unit of the CUP from Reclamation to the Secretary of the Interior; and

WHEREAS, the Secretary desires to use Reclamation's engineering and technical services expertise to assist in the actions described herein; and

WHEREAS, UDOT, an agency of the State of Utah , constructed and continues to construct, operate, maintain, reconstruct, and rehabilitate highways throughout the State of Utah for the purpose of providing public transportation; and

WHEREAS, the parties entered into a Memorandum of Agreement 05-LM-40-02720 September 26, 2005, attached as Exhibit A; and

WHEREAS, UDOT will award a design–build contract to a third party, hereinafter referred to as the "Design-Builder", for the highway project identified as Project No. S-0154(12)11 4 Interchanges on Bangerter Highway (PIN 12566), in Salt Lake County, Utah, hereinafter referred to as the "Highway Project"; and

WHEREAS, UDOT shall require by contract that the Design-Builder administer construction of the Highway Project, including quality control; and

WHEREAS, the Highway Project necessitates expenditures consisting of design engineering and construction for protection of, or encroachment on, or impacts, or relocation to Land Interests of the United States and/or US Facilities on the Highway Project, hereinafter referred to as "Work"; each encroachment or impact or relocation will be the subject of a separate agreement; and

WHEREAS, it is the desire of UDOT for the Design Builder to construct the Work within a tightly controlled schedule that includes completion deadlines; and

DRAFT

WHEREAS, Jordan Valley and the Metropolitan Water District of Salt Lake and Sandy ("Metropolitan Water District") are contractors for the United States and they care for operate and maintain Jordan Aqueduct Reaches 2 and 3 ("JA-2" and "JA-3"). These water districts have the right to the capacity of JA-2 and JA-3 (5/7ths Jordan Valley and 2/7ths Metropolitan Water District). The day-to-day care, operation and maintenance of JA-2 and JA-3 have been delegated to Jordan Valley for the benefit of both districts.

WHEREAS, the United States, its contractors, agents, and assigns will inspect and accept the Work as appropriate to accommodate the Highway Project; and

WHEREAS, for the purpose of expediting the Highway Project, any Work that will impact or encroach on Land Interests of the United States and/or US Facilities will require a separate encroachment or license agreement; and

WHEREAS, it is the desire of UDOT and the United States to enter into this Project Agreement with the understanding that future agreements may be entered into covering Work to be accomplished by UDOT and/or the UDOT's Design Builder at specific Highway Project locations as shown on Exhibit B (Example License Agreement), Exhibit C (Example Encroachment Agreement), and other agreements not attached; and

WHEREAS, in accordance with Utah Code § 72-6-116(3)(a)(ii), UDOT will pay the cost of relocation of US Facilities located on Land Interests of the United States in compliance with 23 C.F.R. §645, subpart A; and

WHEREAS, in accordance with 23 C.F.R. § 645, subpart A, the United States has determined, with the concurrence of UDOT, that accrued depreciation credit is not required as a result of the Work; and

WHEREAS, the US Facilities convey drinking water that serve the residents of Salt Lake County;

NOW, THEREFORE, for good and valuable consideration, the sufficiency of which is hereby acknowledged, the parties agree as follows.

1. SEVERABILITY: Each provision of this Project Agreement shall be interpreted in such a manner as to be valid under applicable law, but if any provision of this Project Agreement shall be deemed or determined by competent authority to be invalid or prohibited hereunder, such provision shall be ineffective and void only to the extent of such invalidity or prohibition, but shall not be deemed ineffective or invalid as to the remainder of such provision or any other remaining provisions, or of the Project Agreement as a whole.

DRAFT

2. HOLD HARMLESS:

   a. In consideration of the United States agreeing to encroachment upon the Land Interests of the United States by UDOT, UDOT hereby agrees to indemnify and hold the United States, its officers, agents, employees, and assigns harmless from any and all claims whatsoever for personal injuries or damages to property when such injuries or damages directly or indirectly arise out of UDOT or its Design-Builder's Work concerning the Highway Project's construction, maintenance, repair, use or the presence of the Highway Project upon the Land Interests of the United States; provided, however, that nothing in this Project Agreement shall be construed as releasing the United States from responsibility for its own negligence. Nothing herein shall be deemed to increase the liability of the United States beyond the provisions of the Federal Tort Claims Act, Act of June 25, 1948, 62 Stat. 989 (28 U.S.C. §1346(b), 2671 et seq.) or other applicable law. Nothing in this Project Agreement shall be construed as a waiver by UDOT of the provisions of the Governmental Immunity Act of Utah (Utah Code Ann. §§ 63G-7-101 et seq.). UDOT's obligation to indemnify shall be limited to the negligence claims allowed by the Federal Tort Claims Act.

   b. In consideration of the United States agreeing to UDOT encroaching upon the Land Interests of the United States, UDOT agrees that the United States shall not be responsible for any damage caused to the Highway Project or related facilities of UDOT, unless such damage is caused by the negligence of the United States or by its contractors, officers, agents, employees or assigns as determined under the provisions of the Federal Tort Claims Act. UDOT hereby releases the United States, its officers, employees, agents, and assigns from liability for any and all loss or damage of every description or kind whatsoever which may result to UDOT from the construction, operation, and maintenance of the Highway Project upon Land Interests of the United States; provided that nothing in this Project Agreement shall be construed as releasing the United States from liability for its own negligence as determined under the provisions of the Federal Tort Claims Act.

   c. UDOT and Jordan Valley are both governmental entities subject to the Utah Governmental Immunity Act. Each party agrees to indemnify, defend, and save harmless the other party from and against all claims, suits and costs, including attorneys' fees, for injury or damage of any kind, arising out of its negligent acts, errors or omissions and the negligent acts, errors or omissions of its officers, agents, contractors or employees in the performance of this Project Agreement. Nothing in this Project Agreement is intended to create additional rights for third parties or to waive any of the provisions of the Utah Governmental Immunity Act. The obligation to indemnify is limited to the dollar amounts set forth in the Utah Governmental

DRAFT

Immunity Act, provided the Act applies to the action or omission giving rise to indemnification under this subparagraph. The indemnification in this subparagraph shall survive the expiration or termination of this Agreement.

3. PROTECTION OF UNITED STATES INTERESTS: UDOT shall comply with all applicable laws, ordinances, rules, and regulations enacted or promulgated by any Federal, State, or local governmental body having jurisdiction over an issue applicable to the Highway Project.

4. ACCESS: The United States and Jordan Valley reserve the right of reasonable access for them and their respective contractors, officers, agents, employees, and assigns to make investigations of all kinds, dig test pits and drill test holes, and to survey for and construct, use, operate, and maintain US Facilities and other improvements related to or connected to JA-2 and JA-3. However, the United States and Jordan Valley and their respective contractors, officers, agents, employees, and assigns shall not access or perform any work on UDOT's right-of-way unless a permit is obtained from UDOT and such permit holder and its contractors, officers, agents, employees, and assigns comply with the permit requirements. The United States and Jordan Valley, and their respective contractors, officers, agents, employees, and assigns shall have the right to enter UDOT's right-of-way in the event of any emergency to make repairs required to prevent loss of life or significant damage to property. The party exercising such right of emergency access and its contractors, officers, agents, employees, and assigns must 1) provide notice to UDOT of entry onto the right-of-way via UDOT's right-of-way and permits officers as soon as practicable but in no event more than 24 hours after entering the right-of-way; and 2) follow guidelines for traffic control as outlined in the Manual of Uniform Traffic Control Devices (MUTCD), Jordan Valley will repair at its expense any damage to UDOT's right-of-way to the extent caused by Jordan Valley or its contractors, officers, agents, employees, and assigns, except as otherwise provided in the Right-of-Way Agreement Between the United States of America Department of the Interior Bureau of Reclamation and Utah Department of Transportation dated July 9, 1991.

5. PROJECT COORDINATION — FOR IMPACTS TO LAND INTERESTS OF THE UNITED STATES AND US FACILITIES
    a. During the development of the Highway Project design, UDOT will consult with Jordan Valley to determine if conflicts, encroachments, and interference with Land Interests of the United States and US Facilities can be avoided. The United States agrees that Jordan Valley will be the designated point of contact for UDOT and its Contactor to consult and coordinate with during the Highway Project. Jordan Valley will consult and coordinate with the United States and the Metropolitan Water District as necessary during the Highway Project.

DRAFT

b. If conflicts, encroachments, or interference with Land Interests of the United States and US Facilities are necessary and/or cannot be reasonably avoided, UDOT will identify the extent of the conflict, encroachment, or interference and propose a solution. In the event of a relocation of US Facilities, the location to which such facilities are to be relocated must be acceptable to the United States and Jordan Valley.

c. The United States, Jordan Valley, and UDOT have determined locations of encroachment on Land Interests of the United States and US Facilities which are shown in attached Exhibit D – Bangerter Interchanges Protect-in-Place.

6. DUTIES TO BE INCORPORATED INTO DESIGN-BUILD CONTRACT

a. UDOT's Responsibilities

i. UDOT may inspect Work items as they pertain to its Highway Project, but shall be responsible for inspection, construction, relocation, or modification of US Facilities.

ii. UDOT will remove certain third-party utilities outside of the Land Interests of the United States upon completion of the 5400 South interchange Project Work as shown in Exhibit E – 5400 South and Bangerter Highway, Jordan Aqueduct Relocation and BOR Aqueduct Existing Utility Actions.

iii. If Work is required on US Facilities, UDOT shall be responsible to identify the conflicts, encroachments, or interference, provide Jordan Valley with Highway Project design plans as early as possible, and schedule and meet with Jordan Valley to review the details of design, construction, estimates of cost, and scheduling for Work at specific locations within the Highway Project.

iv. UDOT shall advise Jordan Valley of the approximate time required for completion of Work and shall diligently pursue its Work so that completion can be accomplished according to the pre-determined time schedule as negotiated by UDOT and Jordan Valley.

v. UDOT shall provide to Jordan Valley for final approval any design documents addressing any conflict, encroachment, or interference with Land Interests of the United States and US Facilities.

1. Design Preparation and Review Time: Jordan Valley requires up to one (1) week for design review after UDOT submits a relocation request and design documents.
2. Address review documents to JT Cracoft, Property Manager, Jordan Valley.

DRAFT

3. UDOT shall provide facility design documents incorporating the Jordan Valley's specifications and drawings, which may be obtained from JT Cracoft.

vi. UDOT shall provide all of the supervision, labor, tools, equipment, and materials for the Work. Jordan Valley shall approve, in advance, Work on Land Interests of the United States and US Facilities. Work by UDOT may include purchasing and hauling materials; cutting asphalt; trenching, equipment installation; backfilling; compacting; clean-up; and completing US Facilities to meet the requirements of this Project Agreement. UDOT shall perform the Highway Project in stages, including facility tie-in and putting US Facilities into service, to minimize disruption to the public and to the United States and its contractors.

vii. Specifications: The specification which is of the higher standard between those of UDOT and Jordan Valley will control where duplication occurs. UDOT will provide to Jordan Valley as-constructed plans in AutoCAD and PDF format upon completion of the Work.

viii. Water Service Disruption: Jordan Valley relies upon the operation of JA-2 and JA-3, among other facilities, to provide water service to its customers. Uncoordinated or prolonged disruption to the operation of any facility may cause Jordan Valley to incur additional expense, including but not limited to the purchase of replacement water, the loss of revenues from water sales, purchase payments made by Jordan Valley on take-or-pay water contracts although Jordan Valley cannot take or use the contract water, and damages paid by Jordan Valley for breach of contract with customers for failure to provide them water. Therefore, United States facilities may be taken out of service by UDOT only pursuant to the following schedule notwithstanding any other provision of this Agreement to the contrary:

Facility	Maximum period facility may be out of service (days)	Time period when no service disruption is permitted	Minimum prior notice to Jordan Valley to request a service disruption
JA-2	15 days	March 1 – Nov. 1	30 days
JA-3	20 days	March 1 – Nov. 1	30 days

*Note: JA-2 and JA-3cannot be taken out of service at the same time.

DRAFT

UDOT shall reimburse Jordan Valley for the actual damages to Jordan Valley for UDOT's breach of the terms of this subparagraph 6(a)(viii).

ix. Construction Inspection: UDOT shall not bury or conceal any portion of the Work that has not been inspected and accepted by Jordan Valley.

x. Cost Allocations: UDOT shall pay the cost of relocation of US Facilities located on Land Interests of the United States in compliance with 23 C.F.R. §645, subpart A. UDOT is 100% responsible for traffic control and surveying.

xi. Inspection of the Work by Jordan Valley shall not relieve UDOT from the obligation to perform all Work in compliance with Jordan Valley's specifications and any other obligations under this Project Agreement.

xii. UDOT shall accomplish the Work on US Facilities in accordance with the plans and specifications approved by Jordan Valley. Any changes or additions to the plans and specifications shall be approved in writing by Jordan Valley.

b. United States and Jordan Valley Responsibilities

i. The United States and Jordan Valley agree to the allocation of responsibilities, and commitments regarding UDOT specified in this Project Agreement. In case of a discrepancy or conflict between the information contained in this Project Agreement and any subsequently executed agreements, the subsequently executed agreements shall govern.

ii. The United States has allowed certain third-party utilities to remain longitudinally within the Land Interests of the United States during the Highway Project as shown in Exhibit E – 5400 South and Bangerter Highway, Jordan Aqueduct Relocation and BOR Aqueduct Existing Utility Actions. UDOT will relocate such third-party utilities outside of the Land Interests of the United States upon completion of the 5400 South interchange.

iii. Jordan Valley will perform the necessary design reviews prior to the start of Work.

iv. The United States and Jordan Valley will inspect UDOT's Work, and will provide UDOT's Project Representative and the Design-Builder's Project Representative with information covering any problems or concerns the United States and Jordan Valley may have with acceptance of the facilities.

v. The United States or Jordan Valley shall notify UDOT's Project Representative of any deficiencies in the Work on US Facilities. UDOT's Project Representative will respond to the concerns within 24 hours of notification.

DRAFT

vi. In the event the United States or Jordan Valley discovers any deficiencies in the Work, including any failure to comply with plans and specifications as required above, Jordan Valley shall make recommendations to UDOT's Project Representative to stop the Work or correct the deficiencies. Jordan Valley and UDOT will immediately thereafter meet to determine a plan to bring the Work into compliance. Any such plans to cure shall be approved by Jordan Valley. Jordan Valley may notify UDOT to stop the Work immediately upon discovery of safety deficiencies during Work in progress.

7. Betterments: Should the United States or Jordan Valley desire and obtain the appropriate authorization to include betterments to its system as part of the Highway Project, the United States or Jordan Valley will be responsible for 100% of any additional costs incurred. For purposes of this Project and Supplemental Agreements, the term betterment is defined as a replacement US Facility desired by the United States which increases or upgrades the service capacity, capability, appearance, efficiency, or function of an existing US Facility. In the event the United States desires to include any betterment Work to be constructed by UDOT, the United States will negotiate with UDOT for the construction of these betterments and will pay to UDOT 100% of any additional costs incurred for the betterments.

8. NOTIFICATION BEFORE BEGINNING CONSTRUCTION WORK: The required notification periods as indicated in this section are for the commencing of any Work provided for by Supplemental Agreement to allow sufficient time for Jordan Valley to schedule an inspector during the Work.

   a. Jordan Valley maintains an 8:00 a.m. to 5:00 p.m., Monday through Friday work week, not including observed holidays. All Work schedule notifications shall be given during the identified time period to JT Cracroft, Property Manager, Jordan Valley.
   b. Jordan Valley requires a minimum of 3 working days' notification prior to beginning weekend and/or night Work.
   c. Jordan Valley requires a minimum of 2 working days' notification to schedule an inspection request.
   d. Jordan Valley requires a minimum of 14 calendar days' notification prior to beginning Work on or affecting existing US Facilities (including limitations to access to US Facilities).
   e. Jordan Valley requires a minimum of 30 calendar days' notification before Work is started on any betterments in order to schedule full-time inspection personnel.

DRAFT

9. TRAFFIC CONTROL AND SURVEYING: UDOT will provide all coordination, traffic control per UDOT standards and Manual on Uniform Traffic Control Devices (MUTCD), and required surveying (line and grade), and will verify the proposed location of relocated US Facilities prior to them being placed in their final position. UDOT will coordinate with Jordan Valley for survey staking. The United States and Jordan Valley shall not be responsible for the costs of any coordination, traffic control, or surveying.

10. FORCE MAJEURE: If, as a result of force majeure, either UDOT, Jordan Valley, or the United States is wholly or partially unable to meet its respective obligations under this Project Agreement other than for payment of monies due, the non-performing party shall give the other parties reasonable notice of such situation, describing it in reasonable detail. Thereupon, the party giving the notice shall be released from its obligations under this Project Agreement to the extent that the force majeure prevents performance of obligations during the continuance of the force majeure. The party having the force majeure shall attempt to cure and mitigate the force majeure as quickly as possible, but if rectification is not possible, the parties shall negotiate an acceptable solution. The term "force majeure" means any cause or condition which is not reasonably within the control of the party claiming the suspension.

11. ACCEPTANCE OF THE WORK: The United States and Jordan Valley, as applicable, agree that upon completion and final inspection of construction, to accept, own (in the case of the United States), and maintain the relocated facilities covered herein at no further cost to UDOT and will notify UDOT of the acceptance.

12. COVENANT AGAINST CONTINGENT FEES: UDOT warrants that no person or agency has been employed or retained to solicit or secure this Project Agreement upon an agreement or understanding for a commission, percentage, brokerage, or contingent fee, excepting bona fide employees or bona fide established agencies maintained by UDOT for the purpose of securing business. For breach or violation of this warranty, the United States and Jordan Valley shall have the right to annul this Project Agreement without liability or in their discretion to require UDOT to pay the full amount of such commission, percentage, brokerage, or contingent fee.

13. HAZARDOUS MATERIALS: UDOT shall comply with all applicable Federal, State, and local laws and regulations, and United States policies and directives and standards, existing or hereafter enacted or promulgated, concerning any hazardous material that will be used, produced, transported, stored, or disposed of on or in Federal lands, waters or facilities. Additional requirements related to specific impacts to US Facilities may be identified in Supplemental Agreements to this Project Agreement.

DRAFT

14. CONTACTS:
    a. Jordan Valley Water Conservancy District: Jordan Aqueduct Reaches 2 & 3
       JT Cracroft; Property Manager; 8215 South 1300 West, West Jordan, UT 84088; 801-565-4300; jtc@jvwcd.org

MEMORANDUM OF AGREEMENT

Between

THE UNITED STATES OF AMERICA,
DEPARTMENT OF THE INTERIOR,
BUREAU OF RECLAMATION

And

THE UTAH DEPARTMENT OF TRANSPORTATION

REGARDING USE OF RECLAMATION LANDS FOR HIGHWAY PROJECTS

DRAFT

THIS Memorandum of Agreement (Agreement), dated this 26th day of September, 2005, in pursuance of the Act of June 17, 1902 (32 Stat. 388), and acts amendatory thereof or supplementary thereto, particularly Section 10 of the Reclamation Project Act of 1939 (53 Stat. 1196; Act of August 18, 1950; 64 Stat. 463; 43 U.S. C. § 387), between THE UNITED STATES OF AMERICA, and its assigns, hereinafter referred to as the United States, acting through the BUREAU OF RECLAMATION, hereinafter referred to as Reclamation, and the UTAH DEPARTMENT OF TRANSPORTATION, hereinafter referred to as UDOT;

WHEREAS, Reclamation, an agency of the United States Government, has constructed and continues to own large projects for the storage and delivery of water; and

WHEREAS, Reclamation, has contracted with various water user organizations to operate and maintain its project facilities; and

WHEREAS, as a result, the United States holds real property interests (fee title and easements) in real property located throughout the State of Utah which it acquired through Reclamation in connection with Reclamation's projects, and which continue to be administered by Reclamation for authorized project purposes; and

WHEREAS, UDOT, a department of the Utah State Government, constructed and continues to construct, operate, maintain, reconstruct, and rehabilitate highways throughout the State of Utah for the purpose of providing public transportation; and

WHEREAS, as a result, UDOT frequently needs to obtain easements over United States' lands administered by Reclamation for various highway construction projects; and

WHEREAS, Reclamation recognizes that UDOT's highway projects serve a public need and have public support, and such easements, if granted by the United States, would be used by UDOT for public benefit; and

WHEREAS, as a result of UDOT's highway projects, Reclamation frequently receives benefit of improved access to United States' lands and facilities which Reclamation administers; and

WHEREAS, as a result of UDOT's highway projects, Reclamation frequently receives benefit from enhanced safety on highways which are used by Reclamation, its employees and contractors, and the general public for access to United States' lands and facilities, as well as from diminished potential for claims of liability resulting from public use of said lands and facilities.

WHEREAS, as a result of UDOT's highway projects, the general public benefits from improved access and safety; and

WHEREAS, UDOT recognizes and agrees that it will be required to comply with environmental laws, including the National Environmental Policy Act, for each of its highway projects, and that it must obtain approval of said compliance by each and every required agency; and

WHEREAS, Reclamation and UDOT wish to cooperate for the best public good to facilitate each agency's respective missions; and

WHEREAS, Reclamation, acting pursuant to 43 CFR 429.6(c) has authority to waive all or part of administrative costs which may be incurred in issuing easements, as follows:

> *All* [administrative] *fees and costs may be waived or reduced at the discretion of the Regional Director, when . . . (3) the holder provides without charges, or at a reduced charge, a valuable service to the public or to the programs of the Department of the Interior.*

WHEREAS, Reclamation, acting pursuant to 43 CFR 429.4 has authority to waive all or part of fair market value compensation for issuing said easements, as follows:

> *Rights of use requested by other Federal or other governmental agencies will be granted with fair market value reimbursement unless a reasonable opportunity exists for the exchange of rights-of use privileges, and there exists an interagency agreement providing for such exchange.*

WHEREAS, Reclamation, acting pursuant to 43 CFR 429.4 has authority to waive all or part of fair market value compensation for issuing said easements, as follows:

DRAFT

Rights of use requested by nonprofit organizations or nonprofit corporations may be provided with no charge being made for the value of these rights-of-use when it is determined that the use will not interfere with the authorized current or planned use of the land by Reclamation.

NOW THEREFORE, whenever UDOT desires the United States to grant an easement for a UDOT highway project across United States lands administered by Reclamation, UDOT and Reclamation agree to follow the following general procedures:

1. UDOT shall submit all request(s) for grants of easement to Reclamation following the format attached as, Exhibit "A".

2. UDOT shall provide Reclamation with an environmental compliance document covering each request. Reclamation shall review and, if appropriate, approve said environmental compliance document prior to granting any easements to UDOT.

3. Reclamation shall waive reimbursement from UDOT for both administrative costs and compensation for fair market value for the granting easements to UDOT as long as UDOT's highway project meets requirements for such a waiver.

4. UDOT and Reclamation, upon mutual agreement, may enter into a temporary contract to allow UDOT to occupy and use areas it requires immediately, prior to the execution of a final contract and grant of easement.

5. Reclamation may alter the format of said easements prior to approval and signing of final contracts and grants of easement, but the legal descriptions and nature of use (perpetual easement) shall be the responsibility of UDOT and shall remain substantially the same.

6. Both parties agree to complete and execute all final contracts and grants of easement in a timely manner.

7. UDOT will obtain concurrence of any water user organization having contractual responsibility for operation and maintenance of the Reclamation project which is affected by UDOT's highway project on all temporary or final contracts.

8. UDOT agrees to conduct all activities within the any easement to be granted to UDOT by the United States in strict accordance with the Protective Criteria contained in Exhibit B attached hereto and by this reference made a part hereof.

9. UDOT shall not remove, relocate, damage, or destroy any facility or structure of the United States without first having entered into a separate contract with the United States covering such issues as design and specifications, funding, construction, and future operation and maintenance of said facility or structure.

DRAFT

10. UDOT shall notify the affected water user organization by telephone Five (5) days in advance of its intent to commence any construction operations.

11. UDOT agrees to reduce impact to soil, vegetation, wildlife and visual resources within the easement area by limiting the amount of surface disturbance.

12. All United States land areas (except portions presently covered by asphalt surfacing) where soils and surface materials are disturbed through actions incident to construction, operation, and maintenance shall be restored by the UDOT to their natural state insofar as practicable by water barring, scarifying, leveling, reseeding, or other practices as prescribed by the United States and to its satisfaction.

13. Unless authorized in writing by the United States, travel by UDOT, its agents or assigns is limited to the area covered by the easements and existing public roads.

14. Disturbance of any improvements encountered during construction, maintenance, and operation of the easements shall be kept to an absolute minimum. UDOT shall immediately restore any damaged improvements at least to their former state. Functional use of these improvements must be maintained at all times.

15. During construction, operation, and maintenance, UDOT shall be particularly alert to take all reasonable and necessary precautions to protect and preserve historic or prehistoric ruins and artifacts on or adjacent to the easements. Should sites, ruins, or artifacts be discovered during these operations, UDOT will immediately suspend work involving the area in question, and advise the United States of suspected values. UDOT shall promptly have the area inspected to determine significance of values and consult with the United States on appropriate actions to follow (recovery, etc., and resumption of work). Cost of any recovery work shall be borne by the UDOT. UDOT shall provide the United States with a copy of any cultural resources survey reports concerning sites located on the temporary easement and shall develop a mitigation plan acceptable to the State Historic Preservation Officer (SHPO) for those significant sites subject to an adverse impact. All objects of antiquity recovered from public lands are the property of the United States and shall be turned over to Reclamation. UDOT is responsible for obtaining required SHPO clearance for any additional survey and report completed.

16. Within sixty (60) days after conclusion of construction operations, all construction materials and related litter and debris, including vegetative cover accumulated through land clearing, shall be disposed of by UDOT in an appropriate manner (State of Utah approved sanitary landfill).

17. UDOT shall designate a representative for field operations who shall be the sole representative of UDOT and UDOT's contractors in dealings with the United States, and shall provide their name, address, and telephone number to the United States and the the Association prior to commencement of construction.

DRAFT

18. UDOT shall comply with existing County, State, and Federal laws concerning the protection and preservation of game, and non-game wildlife species.

19. UDOT shall comply with all State and Federal regulations and laws pertaining to water quality, public health and public safety.

20. UDOT shall be responsible for prevention and suppression of all uncontrolled fires that are caused by UDOT, its agents or assigns.

21. Subject to applicable Federal and State law, UDOT agrees to indemnify and hold harmless the United States against any and all loss or damage and from any liability on account of personal injury, property damage, or claims for personal injury or death arising from its occupancy or use of United States lands or any other rights covered under any temporary or final contract and grant of easement.

22. It is acknowledged and agreed by the parties hereto that, prior to start of construction by UDOT, the United States will have inspected the land area covered by the easements and found it to be free from contamination by hazardous materials of any kind. Removal and clean-up of future contamination, including broken asphalt, resulting from UDOT's use of the easements shall be the sole responsibility of UDOT. Removal and clean-up of any such future contamination, including broken or damaged asphalt, shall be at UDOT's sole expense and shall be accomplished in compliance with all applicable Federal and State laws and regulations.

23. UDOT agrees that in all operations conducted within the easements, it shall comply with applicable State and Federal laws and regulation concerning the use of poisonous substances, including insecticides, herbicides, fungicides, rodenticides, and other similar substances. Prior to the use of such substances on or near the easements, UDOT shall obtain from the United States, approval of a written plan of such use. The plan shall state the type and quantity of material to be used, the pest to be controlled, the method of application, or such other information as may be required. All use of such substances on or near the easements shall be in accordance with the approved plan. If the use of a poison is prohibited by the Environmental Protection Agency (EPA), it shall not be used. If use of a poison is limited by the EPA, it shall be used only in accordance with that limitation.

24. Any proposed additional or subsequent uses by UDOT or others of lands or facilities not covered by the easements must be authorized in advance, in writing by the United States. Additional construction, relocation, or use of the easements that is not in accordance with temporary or final contracts shall not be initiated without prior written approval of the United States and the affected water user organization. Copies of this and other applicable contracts shall be available to construction, operation, and maintenance personnel, as well as personnel of the United States and the Association, during operations.

DRAFT

25. If UDOT violates the terms and conditions of this or any temporary or final contract, the United States shall provide written notice to UDOT describing the violation. Following receipt of said written notice, UDOT shall have 45 days in which to correct said violation. In the event that UDOT fails to correct said violation to the satisfaction of the United States within that time period, title to the easements shall revert to the United States, following written notice by the United States to UDOT.

26. UDOT warrants that no person or selling agency has been employed or retained to solicit or secure this Agreement upon an agreement or understanding for a commission, percentage, brokerage, or contingent fee, excepting bona fide employees or bona fide established commercial or selling agencies maintained by UDOT for the purpose of securing business. For breach or violation of this warranty, the United States shall have the right to annul this Contract and grant without liability.

27. No Member of or Delegate to Congress or Resident Commissioner shall be admitted to any share or part of this Agreement or to any benefit that may arise herefrom, but this restriction shall not be construed to extend to this instrument if made with a corporation or company for its general benefit.

28. The provisions of this Agreement shall run in favor of and bind the assigns of the United States and the successors and assigns of UDOT.

IN WITNESS WHEREOF, the parties hereto have caused this instrument to be executed the day and year first written above.

LICENSE AGREEMENT
BETWEEN THE
UNITED STATES OF AMERICA
AND

THIS LICENSE AGREEMENT, made this _____day of _____, 2016, pursuant to the Act of Congress of June 17, 1902 (32 Stat. 388), and acts amendatory thereof or supplementary thereto, all of which acts are commonly known and referred to as Reclamation Laws, and particularly pursuant to Section 14 of the Act of August 4, 1939, (53 Stat. 1187) among the UNITED STATES OF AMERICA, hereinafter referred to as the United States and _____ hereinafter referred to as the Licensee.

WITNESSETH THAT:

WHEREAS, the Licensee, at its sole cost and expense, proposes to utilize United States lands acquired for the _____, Central Utah Project, State of Utah, hereinafter called the Project Lands and the granting of a license to utilize a portion of the Project Lands in a manner and at the location hereinafter described will not be incompatible with Project purposes;

NOW, THEREFORE, in consideration of the mutual agreements and covenants herein contained, the United States, to the extent of its interest in the Project Lands, hereby grants to the Licensee, upon the terms hereinafter provided, a license for the following purposes and in the location described below:

A. Purpose: To construct, operate and maintain a _____.

B. Period: 25 years from date hereof.

C. Location:

D. Location (Legal Description): A strip of land _____ feet in length and ____ feet in width located in Section __, Township __ South, Range __ East, Salt Lake Base and Meridian, containing __ acres, more or less.

E. Plans, Drawing, or Maps (Attached Hereto and made a Part Hereof):

F. Land Status: Fee Title

1. The federal agency is the Department of the Interior, Bureau of Reclamation, represented by the officer executing this Agreement, his duly appointed successor, or his duly authorized representative.

2. WORK SATISFACTORY. The Licensee shall perform all work under this License Agreement in accordance with the plans, drawings, or maps attached hereto and in a manner satisfactory to the United States and the Central Utah Water Conservancy District, hereinafter referred to as the District.

3. TERM OF LICENSE – TERMINATION: The United States, at its option, may terminate this License Agreement for nonuse of the licensed lands by Licensee for a period of two (2) continuous years. In any event, this license shall expire by limitation at the end of the period recited in Article "B" on Page 1.

a. This License may be revoked by Reclamation upon thirty (30) days written notice to the Licensee if:

1. The United States determines that the Licensee's use of the land is no longer compatible with project purpose.

2. The Licensee fails to comply with the terms or conditions of this License and upon notification of the violation; The Licensee fails to adequately cure the violation within the thirty (30) day time limit. Reclamation will have the final determination regarding the adequacy of the cure.

3. The Licensee use of the land interferes with existing or proposed facilities.

4. ASSIGNMENT OR TRANSFER: This License Agreement shall not be assigned or transferred by the Licensee without the prior written consent of the United States.

5. SEVERABILITY: Each provision of this use authorization shall be interpreted in such a manner as to be valid under applicable law, but if any provision of this use authorization shall be deemed or determined by competent authority to be invalid or prohibited hereunder, such provision shall be ineffective and void only to the extent of such invalidity or prohibition, but shall not be deemed ineffective or invalid as to the remainder of such provision or any other remaining provisions, or of the use authorization as a whole.

6. HOLD HARMLESS:

(a) In consideration of the United States agreeing to encroachment upon the Project Lands of the United States by the Licensee, the Licensee hereby agrees to indemnify and hold the United States and the District, their agents, employees, and assigns, harmless from any and all claims whatsoever for personal injuries or damages to property when such injuries or damages directly or indirectly arise out of the existence, construction, maintenance, repair, condition, use or presence of the encroachment upon fee title land of the United States, regardless of the cause of said injuries or damages; provided, however, that nothing in this agreement shall be construed as releasing the United States or the District from responsibility for their own negligence. Nothing herein shall be deemed to increase the liability of the United States beyond the provisions of the Federal Tort Claims Act, Act of June 25, 1948, 62 Stat. 989 (28 U.S.C. § 1346(b), 2671 et seq.) or other applicable law.

(b) In consideration of the United States agreeing to the Licensee encroaching upon fee title land of the United States, the Licensee agrees that the United States shall not be responsible for any damage caused to facilities, equipment, structures, or other property if damaged by reason of encroachment upon fee title land of the United States by the Licensee. The Licensee hereby releases the United States and the District, their officer, employees, agents, or assigns, from liability for any and all loss or damage of every description or kind whatsoever which may result to the Licensee from the construction, operation, and maintenance of Project works upon said lands; provided that nothing in this Agreement shall be construed as releasing the United States or the District from liability for their own negligence. Nothing herein shall be deemed to increase the liability of the United States beyond the provisions of the Federal Tort Claims Act, Act of June 25, 1948, 62 Stat. 989 (28 U.S.C. § 1346(b), 2671 et seq.) or other applicable law.

(c) If the maintenance or repair of any or all structures and facilities of the United States located on the Project Lands should be made more expensive by reason of the existence of the encroachment improvements or works of the Licensee thereon, Licensee will promptly pay to the United States or the District, their agents or assigns, responsible for operation and maintenance of said structures or facilities, the full amount of such additional expense upon receipt of an itemized bill.

7. RELEASE FROM LIABILITY: The Licensee hereby releases the United States and the District their officers, employees, agents, or assigns, from liability for any and all loss or damage of every description or kind whatsoever, which may result to the Licensee from the construction, operation, and maintenance of Project Works upon said lands, provided that nothing in this License Agreement shall be construed as releasing the United States or the District, from liability for their own negligence.

8. LICENSEE TO DEFEND TITLE: The Licensee shall defend the United States and the District from and against any action which challenges the Licensee's use of Project right-of-way or facilities under this License Agreement, provided the United States or the District promptly tenders such defense prior to the time an answer is due in the proceedings.

9. INTERFERENCE PROHIBITED: The Licensee shall use, occupy, and maintain said facilities with due care to avoid damage to or obstruction of the District or other structures of the United States, or any interference in any way with the operation and maintenance of the same.

10. PROTECTION OF UNITED STATES INTERESTS: The Licensee shall comply with all applicable laws, ordinances, rules, and regulations enacted or promulgated by any Federal, state, or local governmental body having jurisdiction over the encroachment.

11. UNRESTRICTED ACCESS: The United States reserves the right of its officers, agents, and employees at all times to have unrestricted access and ingress to, passage over, and egress from all of said lands, to make investigations of all kinds, dig test pits and drill test holes, to survey for and construct reclamation and irrigation works and other structures incident to

Federal Reclamation Projects, or for any purpose whatsoever. Reclamation will make every reasonable effort to keep damages to a minimum.

12. HAZARDOUS MATERIALS:

(a) The Licensee may not allow contamination or pollution of Federal lands, waters or facilities and for which the Licensee has the responsibility for care, operation, and maintenance by its employees or agents and shall take reasonable precautions to prevent such contamination or pollution by third parties. Substances causing contamination or pollution shall include but are not limited to hazardous materials, thermal pollution, refuse, garbage, sewage effluent, industrial waste, petroleum products, mine tailings, mineral salts, misused pesticides, pesticide containers, or any other pollutants.

(b) The Licensee shall comply with all applicable Federal, State, and local laws and regulations, and Reclamation policies and directives and standards, existing or hereafter enacted or promulgated, concerning any hazardous material that will be used, produced, transported, stored, or disposed of on or in Federal lands, waters or facilities.

(c) "Hazardous material" means any substance, pollutant, or contaminant listed as hazardous under the Comprehensive Environmental Response, Compensation, and Liability Act of 1980, as amended, 42 U.S.C. §9601, et seq., and the regulations promulgated pursuant to that Act.

(d) Upon discovery of any event which may or does result in contamination or pollution of Federal lands, waters or facilities, the Licensee shall initiate any necessary emergency measures to protect health, safety and the environment and shall report such discovery and full details of the actions taken to the Contracting Officer. Reporting may be within a reasonable time period. A reasonable time period means within twenty-four (24) hours of the time of discovery if it is an emergency or by the first working day if it is a non-emergency. An emergency is any situation that requires immediate action to reduce or avoid endangering public health and safety or the environment.

(e) Violation of any of the provisions of this Article, as determined by the Contracting Officer, may constitute grounds for termination of this contract. Such violations require immediate corrective action by the Licensee and shall make the Licensee liable for the cost of full and complete remediation and/or restoration of any Federal resources or facilities that are adversely affected as a result of the violation.

(f) The Licensee agrees to include the provisions contained in paragraphs (a) through (e) of this Article in any assignment, sublease, or other subcontract or third-party contract it may enter into pursuant to this Lease.

(g) Reclamation agrees to provide information necessary for the Licensee using reasonable diligence, to comply with the provisions of this Article.

13. PEST CONTROL:

(a) The Licensee shall not permit use of any pesticides on Federal lands without prior written approval by Reclamation. The Licensee shall submit to Reclamation for approval an Integrated Pest Management Plan (IPMP) thirty (30) days in advance of pesticide application.

(b) All pesticides used shall be in accordance with the current registration, label direction, or other directives regulating their use (State Department of Agriculture, Department of Ecology, OSHA, etc.) and with applicable Reclamation policy and directives and standards. Applicators will meet applicable State training or licensing requirements. Records maintenance shall be in accordance with State requirements and such records shall be furnished to Reclamation not later than five (5) working days after any application of a pesticide.

(c) Any equipment, tools, and machines used for pesticide application shall be in good repair and suitable for such use. Equipment shall be calibrated prior to the spraying season and as deemed necessary by Reclamation.

(d) Mixing, disposal, and cleaning shall be done where pesticide residues cannot enter storm drains, sewers, or other non-target areas.

(e) The Licensee shall initiate any necessary measures for containment and clean up of pesticide spills. Spills shall be reported to the Contracting Officer with full details of the actions taken. Reporting may be within a reasonable time period. A reasonable time period means within twenty-four (24) hours of the spill if it is an emergency, or by the first working day if it is a non-emergency. An emergency is any situation that requires immediate action to reduce or avoid endangering public health and safety or the environment.

(f) Aerial application of pesticides is prohibited without prior written consent by Reclamation's designated representative.

(g) The Licensee agrees to include the provisions contained in paragraph (a) through (f) of this Article in any subcontract or third-party contract it may enter into pursuant to this contract.

14. ILLEGAL USE: Any activity deemed to be illegal on Federal lands will be cause for immediate termination of the use authorization.

15. REMOVAL OF FACILITIES: The United States, its agents or assigns, will determine if the Licensee's facilities will be removed upon termination. If the United States, its agents or assigns, determines that the facility shall be removed, removal will be made within thirty (30) days after termination, and the site will be restored as nearly as practicable to its original condition. Removal of the facilities and restoration of the site will be at the sole expense of the Licensee.

16. NO WARRANTY: The United States makes no warranty, expressed or implied, as to the extent or validity of the grant contained herein.

17. COVENANT AGAINST CONTINGENT FEES: The Licensee warrants that no person or selling agency has been employed or retained to solicit or secure this License Agreement upon an agreement or understanding for a commission, percentage, brokerage, or contingent fee, excepting bona fide employees or bona fide established commercial agencies maintained by the Licensee for the purpose of securing business. For breach or violation of this warranty, the United States shall have the right to annul this License Agreement without liability or in its discretion to require the Licensee to pay, in addition to the License Agreement consideration, the full amount of such commission, percentage, brokerage, or contingent fee.

18. DISCOVERY OF CULTURAL RESOURCES: The Licensee shall immediately provide an oral notification to Reclamation's authorized official of the discovery of any and all antiquities or other objects of archaeological, cultural, historic, or scientific interest on Reclamation lands. The Licensee shall follow up with a written report of their finding(s) to Reclamation's authorized official within forty-eight (48) hours. Objects under consideration include, but are not limited to, historic or prehistoric ruins, human remains, funerary objects, and artifacts discovered as a result of activities under this authorization. The Licensee shall immediately cease the activity in the area of the discovery, make a reasonable effort to protect such discovery, and wait for written approval from the authorized official before resuming the activity. Protective and mitigative measures specified by Reclamation's authorized official shall be the responsibility of the Licensee.

19. ENVIRONMENTAL COMPLIANCE: The Licensee agrees to abide by all applicable Federal, State, and local laws and regulations pertaining to pollution control and environmental protection.

20. LANDSCAPE PRESERVATION AND NATURAL BEAUTY:

(a) The Licensee shall exercise care to preserve the natural landscape and shall conduct its construction operations so as to prevent any unnecessary destruction, scarring, or defacing of the natural surroundings in the vicinity of the work. Except where clearing is required for permanent works, all trees, native shrubbery, and vegetation shall be preserved and shall be protected from damage which may be caused by the Licensee's construction operations and equipment. Movement of crews and equipment within the rights-of-way and over routes provided for access to the work shall be performed in a manner to prevent damage to grazing land, crops, or property.

(b) Upon completion of the work, the construction site shall be smoothed and graded in a manner to conform to the natural topography of the landscape and shall be repaired, replanted, reseeded, or otherwise corrected as directed by the Contracting Officer at the Licensee's expense.

21. OFFICIALS NOT TO BENEFIT: No member of Congress shall be admitted to any share or part of any contract or agreement made, entered into, or accepted by or on behalf of the United States, or to any benefit to arise thereupon.

22. SUCCESSORS IN INTEREST OBLIGATED: The provisions of this Agreement shall inure to the benefit of and be binding upon the heirs, executors, administrators, personal

representatives, successors, and assigns of the parties hereto; provided, however, that no such heir, executor, administrator, personal representative, successor or assign of the Licensee shall have the right to use, alter, or modify the encroachment in a manner which will increase the burden of the encroachment of the Easement of the United States.

23. SPECIAL PROVISIONS: The Special Provisions, attached hereto, are hereby made a part of this License Agreement the same as if they had been expressly set forth herein.

See Exhibit "A"

IN WITNESS WHEREOF, the parties hereto have caused this License Agreement to be executed the day and year first above written.

EXHIBIT B

EXHIBIT "A"

PROTECTION CRITERIA

A. For and in consideration of the License Agreement herein granted, Licensee agrees to pay the United States the following amount:

(1) The sum of One Hundred Dollars ($100), receipt of which is hereby acknowledged, which amount represents administrative expenses incurred by the United States in issuing this License Agreement.

(2) A sum of _____ ($_____) Dollars, which represents the appraised fair market value of the rights granted herein.

B. Prior to the expiration of the term of this License Agreement, and upon application in writing by Licensee and approval by the United States and the District, this License Agreement may be renewed for such period as the parties hereto may agree upon. If so renewed, the consideration to be paid for renewal will be determined by reappraisal by the United States. Furthermore, the renewed License Agreement, will be subject to the regulations existing at the time of renewal and such other terms and conditions as may be deemed necessary by the United States and the District to protect the public interest or its projects

C. The Licensee shall notify the United States at (801) 379-1000 and the District at (801) 226-7100, five (5) days in advance of its intent to commence any construction operations associated with rights herein granted.

D. Existing gravity drainage of the United States rights-of-way must be maintained. No new concentration of surface or subsurface drainage may be directed onto or under the United States rights-of-way without adequate provision for removal of drainage water or protection of the United States rights-of-way.

E. During construction, operation, and maintenance, the Licensee shall be particularly alert to take all reasonable and necessary precautions to protect and preserve historic or prehistoric ruins and artifacts on or adjacent to the lands herein described. Should sites, ruins, or artifacts be discovered during these operations, the Licensee will immediately suspend work involving the area in question, and advise the United States of suspected values. The Licensee shall promptly have the area inspected to determine significance of values and to consult with the United States on appropriate actions to follow (recovery, etc., and resumption of work). Cost of any recovery work shall be borne by the Licensee. The Licensee shall provide the United States with a copy of any cultural resources survey reports concerning sites located on the lands described herein and shall develop a mitigation plan acceptable to the Utah State Historic Preservation officer (SHPO) for those significant sites subject to an adverse impact. All objects of antiquity recovered from public lands are the property of the United States and shall be turned over to the Bureau of Reclamation. The Licensee is responsible for obtaining required Utah SHPO clearance for any additional survey and report completed. Any person who knows or has reason

to know that he or she has inadvertently discovered possible human remains on Federal or Tribal land, must provide immediate telephone notification of the inadvertent discovery to the Bureau of Reclamation Provo Area Office archaeologist. Work will stop until the proper authorities are able to assess the situation on site. This action must promptly be followed by written confirmation to the responsible Federal Agency official with respect to Federal lands. On Tribal lands, it is to be reported to the responsible Indian Tribal official. This requirement is prescribed under the Native American Graves Protection and Repatriation Act (P.L. 101-601; 104 Stat. 3042) of November 1990.

F. Prior to construction of any structure that encroaches within United States rights-of-way, an excavation must be made to determine the location of existing United States facilities. The excavation must be made by or in the presence of the District or the United States.

G. Any contractor or individual constructing improvements in, on, or along United States rights-of-way must limit his construction to the encroachment structure previously approved and construct the improvements strictly in accordance with plans or specifications.

H. All United States land areas where soils and surface materials are disturbed through actions incident to construction, operation and maintenance shall be restored to their natural state insofar as practical by water barring, scarifying, leveling and reseeding, or other practices as prescribed by the United States and to its satisfaction.

I. The Licensee shall restore any damaged or disturbed improvements such as fences, roads, watering facilities, etc., encountered during construction, maintenance, and operation. Functional use of these improvements must be maintained at all times.

J. Within sixty (60) days after conclusion of construction operations, all construction materials and related litter and debris, including vegetative cover accumulated through land clearing, shall be disposed of in an appropriate manner (State of Utah approved sanitary landfill).

K. The owner of newly constructed facilities that encroach on United States rights-of-way shall notify the United States and/or the District upon completion of construction and shall provide the District with one copy and the United States with two copies of as-built drawings showing actual improvements in, on, or along the rights-of-way. Also, provide one copy of drawings on a 3 ½ IBM compatible floppy disk or CD in AutoCAD version 14 format or other format approved by United States, Bureau of Reclamation, within 30 days of completion.

L. Except in case of ordinary maintenance and emergency repairs, an owner of encroaching facilities shall give the District at least 10 days notice in writing before entering upon United States rights-of-way for the purpose of reconstructing, repairing, or removing the encroaching structure or performing any work on or in connection with the operation of the encroaching structure.

M. If unusual conditions are proposed for the encroaching structure or unusual field conditions within United States rights-of-way are encountered, the United States reserves the right to impose more stringent criteria than those prescribed herein.

N. All backfill material within United States rights-of-way shall be compacted to 95 percent of maximum density unless otherwise shown. Mechanical compaction shall not be allowed within 6 inches of the projects works whenever possible. In no case will mechanical compaction using heavy equipment be allowed over the project works or within 18 inches horizontally of the projects works.

O. That the backfilling of any excavation or around any structure within the United States rights-of-way shall be compacted in layers not exceeding 6 inches thick to the following requirements: (1) cohesive soils to 90 percent maximum density specified by ASTM Part 19, D-698, method A; (2) noncohesive soils to 70 percent relative density specified by ANSI/ASTM Part 19, d-2049, par. 7.1.2, wet method.

P. Any nonmetallic encroaching structure below ground level shall be accompanied with warning tape. This tape shall be located 12 inches above the structure and extend from the right-of-way to right-of-way. If the encroaching structure is nonmetallic, the warning tape must include a metallic strip.

Q. No use of United States lands or rights-of-way shall be permitted that involve the storage of hazardous material.

R. For all utility crossings, a permanent placard shall be placed at each point that the utility enters or exits the right-of-way of the United States. This placard shall identify the type of utility located below it, the name of the utility company and a telephone number where the utility company can be reached.

DEPARTMENT OF THE INTERIOR
BUREAU OF RECLAMATION
CENTRAL UTAH PROJECT

EASEMENT ENCROACHMENT AGREEMENT
BETWEEN THE
UNITED STATES OF AMERICA
AND

This Easement Encroachment Agreement made this _____day of _____2016, pursuant to the Act of Congress of June 17, 1902 (32 Stat. 388), and acts amendatory thereof or supplementary thereto, all of which acts are commonly known and referred to as Reclamation Laws, among the UNITED STATES OF AMERICA and its assigns, hereinafter referred to as the United States, and _____, hereinafter referred to as the Landowner.

WITNESSETH THAT:

WHEREAS, the United States is the Grantee of that certain easement granted by _____, which easement is recorded in the official records of _____, State of Utah, hereinafter referred to as the Easement of the United States; and

WHEREAS, the Landowner plans to utilize its property in such a manner as to encroach upon the Easement of the United States in a manner more particularly specified hereinafter; and

WHEREAS, the United States is willing to agree to said encroachment, upon conditions more particularly specified hereinafter;

NOW, THEREFORE, the United States hereby agrees to encroachment upon the Easement of the United States by the Landowner only to the extent and for the purposes set forth below:

1. The federal agency is the Department of the Interior, Bureau of Reclamation, represented by the officer executing this Agreement, his duly appointed successor, or his duly authorized representative.

2. The United States guidelines for agreeing to such encroachment upon the Easement of the United States are shown on Exhibit "A," attached hereto and by this reference made a part hereof.

3. The Landowner or its Contractor shall perform all work within the encroachment area in accordance with the plans, drawings, guidelines, and maps attached hereto, and in a manner satisfactory to the United States and _____, hereinafter called the District.

4. SEVERABILITY: Each provision of this use authorization shall be interpreted in such a manner as to be valid under applicable law, but if any provision of this use authorization shall be deemed or determined by competent authority to be invalid or prohibited hereunder, such provision shall be ineffective and void only to the extent of such invalidity or prohibition, but shall not be deemed ineffective or invalid as to the remainder of such provision or any other remaining provisions, or of the use authorization as a whole.

5. ILLEGAL USE: Any activity deemed to be illegal on Federal lands will be cause for immediate termination of the use authorization.

6. TERMINATION OF AGREEMENT: This agreement will terminate and all rights of the Landowner hereunder will cease, and the Landowner will quietly deliver to the United States possession of the premises in like condition as when taken, reasonable wear and damage by the elements excepted, after failure of the Landowner to observe any of the conditions of this agreement, and on the tenth day following service of written notice on the Landowner of termination because of failure to observe such condition.

7. HOLD HARMLESS: The Landowner hereby agrees to indemnify and hold harmless the United States, its employees, agents, and assigns from any loss or damage and from any liability on account of personal injury, property damage, or claims for personal injury or death arising out of the Landowner activities under this agreement.

(a) In consideration of the United States agreeing to encroachment upon the Easement of the United States by the Landowner, the Landowner hereby agrees to indemnify and hold the United States and the District, their agents, employees, and assigns, harmless from any and all claims whatsoever for personal injuries or damages to property when such injuries or damages directly or indirectly arise out of the existence, construction, maintenance, repair, condition, use or presence of the encroachment upon the Easement of the United States, regardless of the cause of said injuries or damages; provided, however, that nothing in this agreement shall be construed as releasing the United States or the District from responsibility for their own negligence. Nothing herein shall be deemed to increase the liability of the United States beyond the provisions of the Federal Tort Claims Act, Act of June 25, 1948, 62 Stat. 989 (28 U.S.C. §1346(b), 2671 et seq.) or other applicable law.

(b) In consideration of the United States agreeing to the Landowner encroaching upon the Easement of the United States, the Landowner agrees that the United States shall not be responsible for any damage caused to facilities, equipment, structures, or other property if damaged by reason of encroachment upon the Easement of the United States by the Landowner. The Landowner hereby releases the United States and the District, their officers, employees, agents, or assigns, from liability for any and all loss or damage of every description or kind whatsoever which may result to the Landowner from the construction, operation, and maintenance of Project works upon said lands; provided that nothing in this Agreement shall be construed as releasing the United States or the District from liability for their own negligence. Nothing herein shall be deemed to increase the liability of the United States beyond the provisions of the Federal Tort Claims Act, Act of June 25, 1948, 62 Stat. 989 (28 U.S.C. §1346(b), 2671 et seq.) or other applicable law.

(c) If the maintenance or repair of any or all structures and facilities of the United States located on the easement area should be made more expensive by reason of the existence of the encroachment improvements or works of the Landowner or its Contractor, the Landowner and /or its Contractor will promptly pay to the United States or the District, their agents or assigns, responsible for operation and maintenance of said structures or facilities, the full amount of such additional expense upon receipt of an itemized bill.

8. PROTECTION OF UNITED STATES INTERESTS: The Landowner shall comply with all applicable laws, ordinances, rules, and regulations enacted or promulgated by any Federal, state, or local governmental body having jurisdiction over the encroachment.

9. UNRESTRICTED ACCESS: The United States reserves the right of its officers, agents, and employees at all times to have unrestricted access and ingress to, passage over, and egress from all of said lands, to make investigations of all kinds, dig test pits and drill test holes, to survey for and construct reclamation and irrigation works and other structures incident to Federal Reclamation Projects, or for any purpose whatsoever. Reclamation will make every reasonable effort to keep damages to a minimum.

10. COVENANT AGAINST CONTINGENT FEES: The Landowner warrants that no person or agency has been employed or retained to solicit or secure this agreement upon an agreement or understanding for a commission, percentage, brokerage, or contingent fee, excepting bona fide employees or bona fide established agencies maintained by the Lessee for the purpose of securing business. For breach or violation of this warranty, the United States shall have the right to annul this agreement without liability or in its discretion to require Landowner to pay the full amount of such commission, percentage, brokerage, or contingent fee.

11. OFFICIALS NOT TO BENEFIT: No member of Congress shall be admitted to any share or part of any contract or agreement made, entered into, or accepted by or on behalf of the United States, or to any benefit to arise thereupon.

12. SUCCESSORS IN INTEREST OBLIGATED: The provisions of this Agreement shall inure to the benefit of and be binding upon the heirs, executors, administrators, personal representatives, successors, and assigns of the parties hereto; provided, however, that no such heir, executor, administrator, personal representative, successor or assign of the Landowner shall have the right to use, alter, or modify the encroachment in a manner which will increase the burden of the encroachment of the Easement of the United States.

13. This agreement makes no finding as to the right, title, or validity of the Landowner or the encroaching interest, but merely defines the conditions under which the encroachment will not be deemed unreasonable by the United States.

IN WITNESS WHEREOF, the parties hereto have executed this Agreement the day and year first above written.

EXHIBIT C

EXHIBIT "A"

ENCROACHMENT GUIDELINES FOR

PROTECTION CRITERIA

A. Surface structures that generally will be allowed to be constructed within United States rights-of-way include asphalt roadways, with no utilities within roadway, non reinforced parking lots, curbs, gutters and sidewalks, walkways, driveways. However, where United States system pipe has specific maximum and minimum cover designation the special requirements for roadways, parking lots and driveways crossing over the pipe shall be obtained from the United States for the maximum allowable external loading or minimum cover. **HOWEVER, IT IS UNDERSTOOD THAT ALL SURFACE STRUCTURES SHALL BE ANALYZED AND CONSIDERED ON AN INDIVIDUAL BASIS.**

B. Structures that may not be constructed in, on, or along United States rights-of-way include but are not limited to, permanent structures such as fences, retaining walls, block walls, buildings, garages, decks, carports, trailers, and swimming pools as designated by the United States.

C. No trees or vines will be allowed within the rights-of-way of the United States.

D. All temporary or permanent changes in ground surfaces within United States rights-of-way are to be considered to be encroaching structures and must be handled as such. Earthfills and cuts on adjacent property shall not encroach onto United States rights-of-way without prior approval by the United States.

E. Existing gravity drainage of the United States rights-of-way must be maintained. No new concentration of surface or subsurface drainage may be directed onto or under the United States rights-of-way without adequate provision for removal of drainage water or adequate protection of the United States rights-of-way.

F. Prior to construction of any structure that encroaches within United States rights-of-way, an excavation must be made to determine the location of existing United States facilities. The excavation must be made by or in the presence of water users or the United States.

G. Any contractor or individual constructing improvements in, on, or along United States rights-of-way must limit his construction to the encroaching structure previously approved and construct the improvements strictly in accordance with plans or specifications.

H. The ground surfaces within United States rights-of-way must be restored to a condition equal to that which existed before the encroachment work began or as shown on the approved plans or specifications.

I. The owner of newly constructed facilities that encroach on United States rights-of-way shall notify the United States and/or the District upon completion of construction and shall provide the

District with one copy and the United States with two copies of as-built drawings showing actual improvements in, on, or along the rights-of-way.

J. Except in case of ordinary maintenance and emergency repairs, an owner of encroaching facilities shall give the District at least 10 days' notice in writing before entering upon United States rights-of-way for the purpose of reconstructing, repairing, or removing the encroaching structure or performing any work on or in connection with the operation of the encroaching structure.

K. If unusual conditions are proposed for the encroaching structure or unusual field conditions within United States rights-of-way are encountered, the United States reserves the right to impose more stringent criteria than those prescribed herein.

L. All backfill material within United States rights-of-way shall be compacted to 90 percent of maximum density unless otherwise shown. Mechanical compaction shall not be allowed within 6 inches of the projects works whenever possible. In no case will mechanical compaction using heavy equipment be allowed over the project works or within 18 inches horizontally of the projects works.

M. That the backfilling of any excavation or around any structure within the United States rights-of-way shall be compacted in layers not exceeding 6 inches thick to the following requirements: (1) cohesive soils to 90 percent maximum density specified by ASTM Part 19, D-698, method A; (2) non-cohesive soils to 70 percent relative density specified by ANSI/ASTM Part 19, d-2049, par. 7.1.2, wet method.

N. Any nonmetallic encroaching structure below ground level shall be accompanied with a metallic strip within the United States rights-of-way.

O. Owners of encroaching facilities shall notify the United States at (801) 379-1000 and/or the District at _____ at least forty-eight (48) hours in advance of commencing construction to permit inspection by the United States and/or the District.

P. No use of United States lands or rights-of-way shall be permitted that involve the storage of hazardous material.

GENERAL NOTES:

1. THE CONTRACTOR SHALL TAKE ALL PRECAUTIONARY MEASURES NECESSARY TO PROTECT EXISTING IMPROVEMENTS FROM DAMAGE WHICH ARE TO REMAIN IN PLACE. ALL SUCH IMPROVEMENTS OR STRUCTURES DAMAGED BY THE CONTRACTORS OPERATIONS SHALL BE REPAIRED OR RECONSTRUCTED TO ORIGINAL OR BETTER CONDITION TO THE SATISFACTION OF THE OWNER AT THE EXPENSE OF THE CONTRACTOR.
2. CONTRACTOR IS SOLELY RESPONSIBLE FOR CONFORMANCE WITH LOCAL AND FEDERAL CODES GOVERNING SHORING AND BRACING OF EXCAVATIONS AND TRENCHES. CONTRACTOR IS RESPONSIBLE FOR THE SAFETY OF THE PUBLIC AND PROTECTION OF PERSONNEL AND WORKERS.
3. DEWATERING: GROUND WATER AND SURFACE WATER CONTROL SHALL BE PERFORMED AND RESPONSIBLY HANDLED BY THE CONTRACTOR ACCORDING TO, AND IN COMPLIANCE WITH, ALL LOCAL GOVERNING AUTHORITIES. GROUND WATER AND/OR SURFACE WATER PUMPING MAY BE REQUIRED. IT IS THE CONTRACTOR'S SOLE RESPONSIBILITY TO DETERMINE POTENTIAL PUMPING NEEDS. CONTRACTOR SHALL OBTAIN DEWATERING PERMIT AS NECESSARY.
4. CONTRACTOR SHALL PREVENT ANY GROUND WATER OR DEBRIS FROM ENTERING NEW PIPES DURING CONSTRUCTION. THE ENDS OF THE PIPES SHALL BE SEALED AT THE END OF EACH WORKDAY.
5. PROFILE DRAWINGS ARE HORIZONTAL PROJECTIONS OF THE PIPELINE CENTERLINE, UNLESS OTHERWISE NOTED.
6. LAY PIPE TO DEPTH AND ALONG HORIZONTAL ALIGNMENT AS DEFINED IN THESE DRAWINGS. CONTRACTOR SHALL NOT DEVIATE FROM PROPOSED ALIGNMENT OR GRADE WITHOUT THE WRITTEN APPROVAL OF THE ENGINEER. AVOID HIGH AND LOW POINTS EXCEPT WHERE DESIGNED.
7. CONTRACTOR SHALL PERFORM CHLORINATION TEST, PRESSURE TEST, AND BACTERIA TEST. ALL WATERLINES INSTALLED SHALL BE DISINFECTED IN ACCORDANCE WITH THE "AMERICAN WATER WORKS ASSOCIATION STANDARD FOR DISINFECTING WATER MAINS" (AWWA C651). ALL CHLORINATED WATER SHALL BE DISPOSED OF IN ACCORDANCE WITH THE UTAH DEPT OF ENVIRONMENTAL QUALITY RULES AND REQUIREMENTS FOR SURFACE DISCHARGE.
8. PRESSURE TEST ALL PIPELINES TO 100 PSI FOR FOUR HOURS WITH ZERO LEAKAGE. IN THE CASE OF PIPELINES THAT FAIL TO PASS THE LEAKAGE TEST, THE CONTRACTOR SHALL DETERMINE THE CAUSE OF THE EXCESSIVE LEAKAGE, SHALL TAKE CORRECTIVE MEASURES NECESSARY TO REPAIR THE LEAKS, AND SHALL AGAIN TEST THE PIPELINES, ALL AT NO COST TO THE OWNER.
9. ALL MATERIALS WHICH MAY CONTACT DRINKING WATER INCLUDING PIPES, GASKETS, LUBRICANTS, AND O-RINGS, SHALL BE ANSI-CERTIFIED AS MEETING THE REQUIREMENTS OF NSF STANDARD 61, DRINKING WATER SYSTEM COMPONENTS-HEALTH EFFECTS. TO PERMIT FIELD VERIFICATION OF THIS CERTIFICATION, ALL SUCH COMPONENTS SHALL BE APPROPRIATELY STAMPED WITH THE NSF LOGO.
10. HYDRAULIC DESIGN CRITERIA OF JA-3 RELOCATION SEGMENT – 50 PSI WORKING PRESSURE AND 100 PSI TEST PRESSURE.
11. CONTRACTOR SHALL PROTECT THE EXISTING JORDAN AQUEDUCT. DO NOT STOCKPILE MATERIALS OVER THE EXISTING PIPELINE OR OTHERWISE INCREASE OR DECREASE THE COVER ON THE EXISTING PIPELINE. CONTRACTOR SHALL CONDUCT OPERATIONS AS TO PREVENT OPERATION OF HEAVY EQUIPMENT THAT MAY POINT LOAD OR OTHERWISE NEGATIVELY IMPACT THE EXISTING AQUEDUCT. OPERATION OF CONSTRUCTION EQUIPMENT WITHIN THE AQUEDUCT EASEMENT SHALL BE SUBJECT TO BOR APPROVAL.

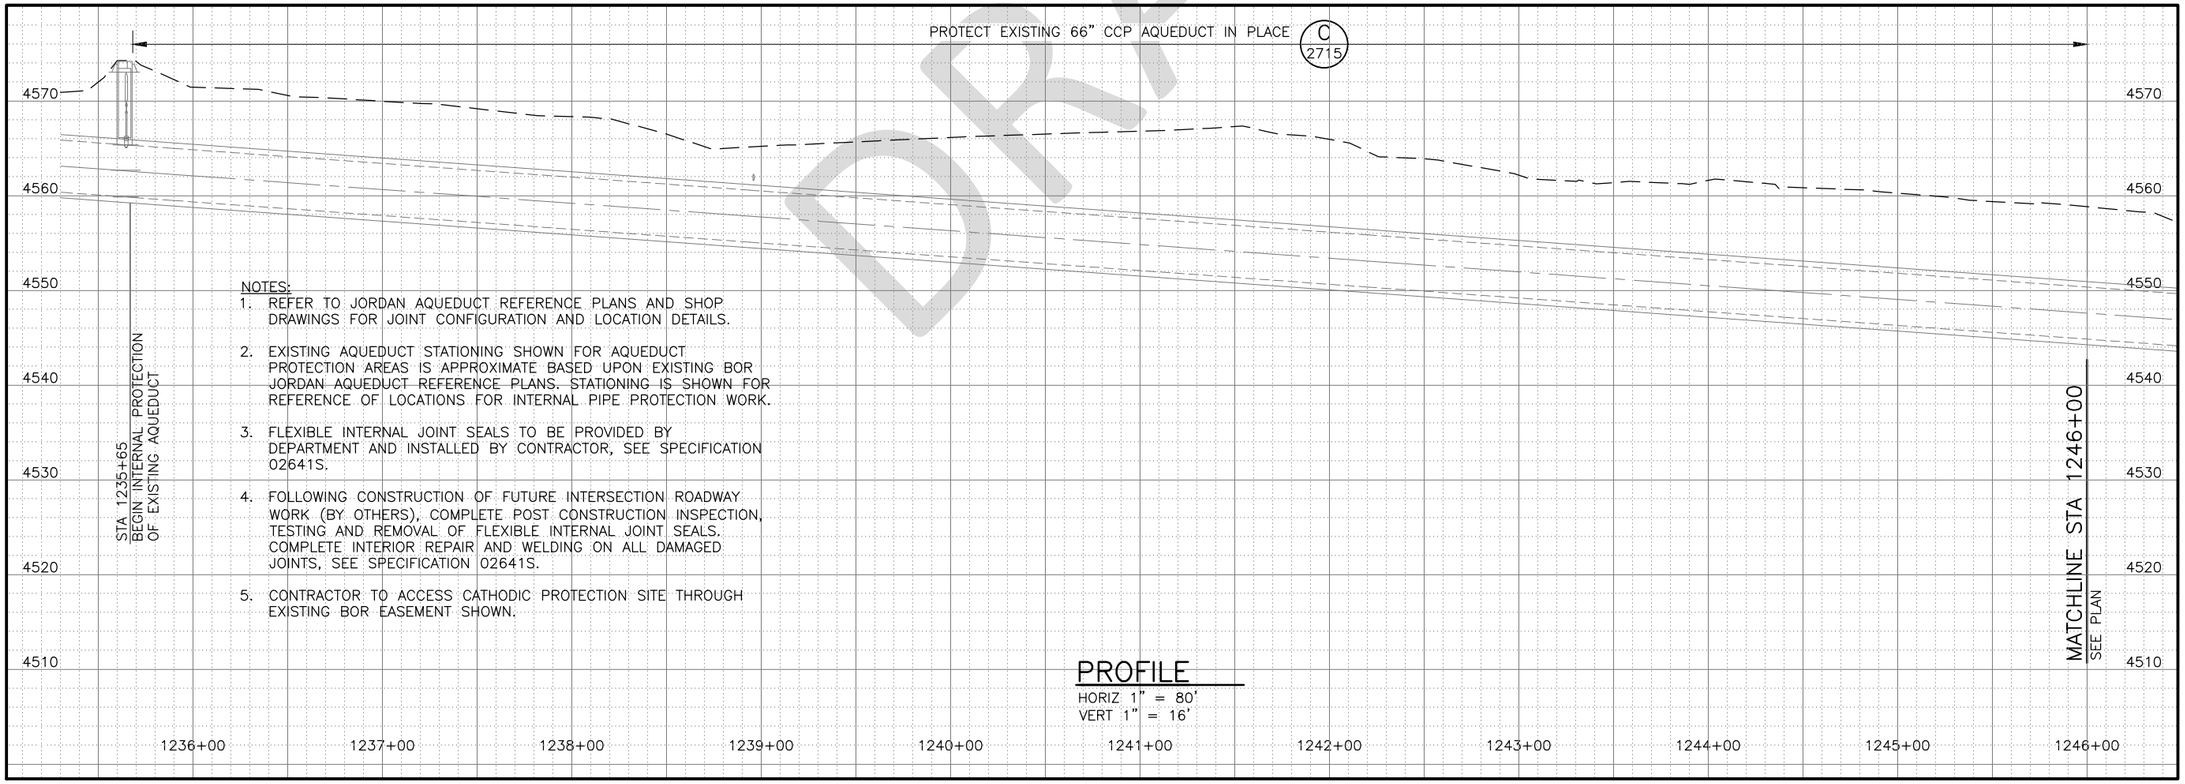
PLAN



NOTES:

1. REFER TO JORDAN AQUEDUCT REFERENCE PLANS AND SHOP DRAWINGS FOR JOINT CONFIGURATION AND LOCATION DETAILS.
2. EXISTING AQUEDUCT STATIONING SHOWN FOR AQUEDUCT PROTECTION AREAS IS APPROXIMATE BASED UPON EXISTING BOR JORDAN AQUEDUCT REFERENCE PLANS. STATIONING IS SHOWN FOR REFERENCE OF LOCATIONS FOR INTERNAL PIPE PROTECTION WORK.
3. FLEXIBLE INTERNAL JOINT SEALS TO BE PROVIDED BY DEPARTMENT AND INSTALLED BY CONTRACTOR, SEE SPECIFICATION 02641S.
4. FOLLOWING CONSTRUCTION OF FUTURE INTERSECTION ROADWAY WORK (BY OTHERS), COMPLETE POST CONSTRUCTION INSPECTION, TESTING AND REMOVAL OF FLEXIBLE INTERNAL JOINT SEALS. COMPLETE INTERIOR REPAIR AND WELDING ON ALL DAMAGED JOINTS, SEE SPECIFICATION 02641S.
5. CONTRACTOR TO ACCESS CATHODIC PROTECTION SITE THROUGH EXISTING BOR EASEMENT SHOWN.

PIPE LINE PLAN AND PROFILE TEST STATION LEGEND

X — EXST TEST STATION
X=TYPE

X — NEW TEST STATION
X=TYPE

TEST STATION NOTES:

1. CONTRACTOR TO INSTALL NEW TEST STATION WHERE INDICATED ON THE PIPELINE PLAN AND PROFILE SHEETS.
2. EXISTING TEST STATION SHALL BE RELOCATED OR REPLACED WHERE INDICATED OR WHEN DAMAGED BY PIPE CONSTRUCTION WORK. .
3. ALL TEST STATIONS SHALL BE STEEL CONDUIT POST MOUNT STYLE.
4. MARK TEST STATIONS WITH JVWCD DISTRICT APPROVED LABEL WITH DISTRICT NAME, PIPELINE, AND PIPE STATIONING.
5. PROVIDE WIRE LOOP AT BASE OF TEST STATION AND AT PIPE CONNECTIONS TO MINIMIZE SETTLEMENT STRESSES ON WIRE.
6. PROVIDE SUFFICIENT WIRE TO ALLOW FOR PROPER TERMINATION IN TEST STATIONS.
7. ALL WIRES TO BE INSTALLED SPLICE FREE.
8. ALL WIRE CONNECTIONS TO PIPE SHALL BE THERMITE WELDED CONNECTIONS, EACH WIRE CONNECTION TO BE SEPARATED A MINIMUM OF 6-INCHES.
9. QUANTITY OF TERMINALS AND WIRING CONNECTIONS VARIES, SEE APPLICABLE DETAIL FOR TEST STATION TYPE.
10. ALL WIRES UNDER ROADWAY MUST BE PROTECTED BY 2" PVC COATED RIGID STEEL CONDUIT AS SHOWN IN DETAILS, SEAL ENDS OF CONDUIT WITH DUCT COMPOUND OR URETHANE FOAM.
11. DO NOT DIRECTLY CONNECT ROADWAY OFFSET CONDUIT TO TEST STATION CONDUIT.

JA-56S SITE PLAN NOTES:

ELECTRICAL SERVICE:

1. CONTRACTOR TO COORDINATE ELECTRICAL SERVICE PER WORK ORDER #621105, RMP CONTACT IS HENRY TSOSIE.
2. CONTRACTOR SHALL INSTALL NEW AC POWER SERVICE IN ACCORDANCE WITH ROCKY MOUNTAIN POWER. REQUIREMENTS, NEW UTILITY SERVICE INSTALLATION COST TO BE PAID BY DEPARTMENT.
3. UTILITY AC SERVICE TO INCLUDE CONDUIT WITHIN 1 FOOT FROM TRANSFORMER BOX, UNDERGROUND CONDUIT, AND UNDERGROUND AC SERVICE PEDESTAL.
4. CONTRACTOR TO PROVIDE ALL EXCAVATION, BACKFILL, CONDUIT AND PULL STRING FOR AC POWER SERVICE TO METER PEDESTAL, UTILITY TO PROVIDE AND INSTALL CONDUCTORS, SPLICES, AND CONNECTIONS TO METER BASE.

GROUNDBED CONSTRUCTION

1. DRILLING MUD, WATER AND CUTTINGS SHALL BE FULLY CONTAINED ON THE PROJECT SITE AND SHALL NOT BE PERMITTED TO FLOW OVER THE GROUND SURFACE,
2. ANY SPILLAGE OR LEAKAGE OF DRILLING MUD AND CUTTINGS SHALL BE REMOVED AND DISPOSED OF BY THE CONTRACTOR AND THE SITE RESTORED.
3. DIGGING OF MUD PIT WILL NOT BE PERMITTED.
4. DRILL CUTTINGS TO BE REMOVED FROM SITE AND DISPOSED AT OFFSITE LANDFILL OR OTHER APPROVED LOCATION.

RECTIFIER INSTALLATION

1. CONCRETE WORK SHALL BE AA (AE) PER UDOT STANDARDS.
2. FORMS SHALL BE SET LEVEL AND SQUARE.
3. CONCRETE FINISH SHALL BE TROWELED SURFACE AND RADIUS EDGES.
4. ALL FORM WORK SHALL BE REMOVED FROM THE CONCRETE AFTER CURING IS COMPLETED.
5. RECTIFIER SHALL BE ORIENTED AS SHOWN ON THE PLANS, ADJUSTMENT IN THE LOCATION AND ORIENTATION OF THE RECTIFIERS AND VENT PIPES SHALL BE APPROVED BY THE ENGINEER.

SITE WORK AND RESTORATION:

1. EXISTING VEGETATION TO BE CLEARED AND GRUBBED TO A DEPTH OF 12-INCHES WHERE INDICATED ON THE PLAN OR WHERE TRENCHING IS REQUIRED.
2. ALL DISTURBED AREAS TO BE RE-SEEDED FOLLOWING CONSTRUCTION PER UDOT STANDARD SPECIFICATIONS.

JA3 CATHODIC PROTECTION STATION

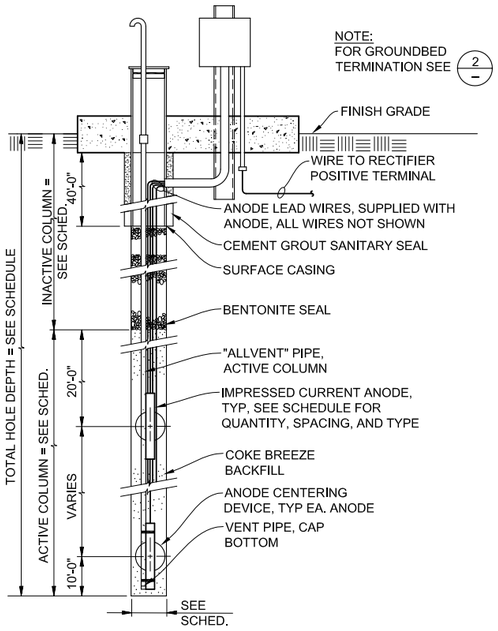
CATHODIC PROTECTION SITE PLAN

SHEET NO. CP-01

EXHIBIT E

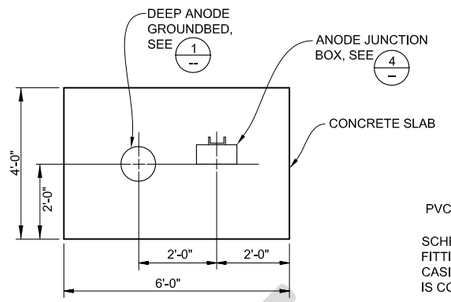
H:\BC\ABCA-034\Design\JA2 CP Relocation Site Plan.dwg Plotted 7/14/2016 By: Stacy Hilling



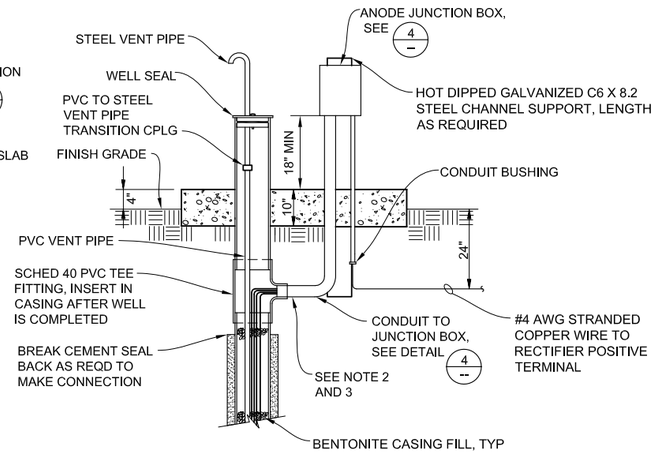
NOTES:
1. CASING LENGTH IS MINIMUM LENGTH, CONTRACTOR TO PROVIDE CASING LENGTH AS REQUIRED FOR DRILLING CONDITIONS AND AS SPECIFIED.
2. SEE CATHODIC PROTECTION SITE PLAN FOR GROUNDBED LOCATION AND SCHEDULE.
3. ALL PIPE AND CONDUIT PENETRATIONS THROUGH SURFACE CASING SHALL BE WATERTIGHT, SOLVENT WELDED, PENETRATIONS OR AN APPROVED EQUAL.

DEEP ANODE GROUND BED - TYPE 1

NOT TO SCALE — 1 / CP-01



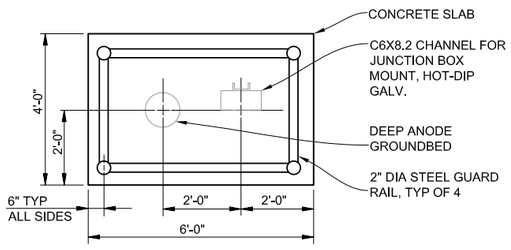
PLAN



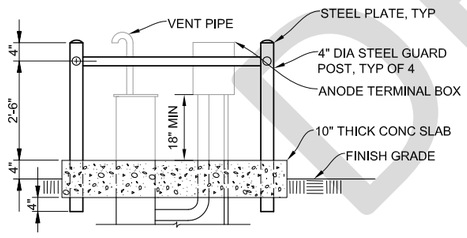
NOTES:
1. PROTECT WIRES FROM NICKS, CUTS, OR OTHER DAMAGE WHEN CUTTING CASING.
2. SEAL CONDUIT AT EACH END WITH URETHANE FOAM TO PREVENT ENTRY OF GROUNDBED GASES OR MOISTURE INTO JUNCTION BOX.
3. ALL BURIED CASING AND CONDUIT JOINTS TO BE SOLVENT WELDED FOR WATERTIGHT CONNECTIONS.
4. FINISH GRADE AWAY FROM WELL CASING.

TYPE 1 SURFACE CASING AND TERMINATION

NOT TO SCALE — 2 / --



PLAN

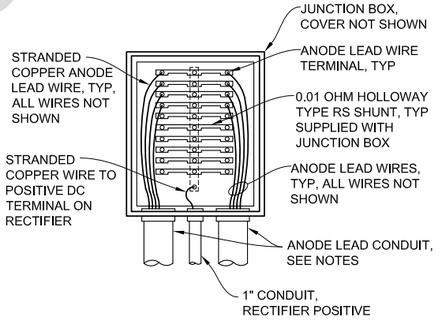


ELEVATION

NOTES:
1. BOLT TWO FRONT RAILS TO GUARD POSTS AND WELD ALL REMAINING RAILS TO GUARD POSTS.
2. ORIENTATION OF ANODE JUNCTION BOX TO BE DETERMINED IN THE FIELD.
3. HOT DIP GALVANIZE GUARD RAIL AND VENT PIPE AFTER FABRICATION.
4. ORIENT EQUIP TO ALLOW ACCESS DOORS TO FULLY OPEN WITHOUT OBSTRUCTION.

GROUNDBED GUARD RAIL

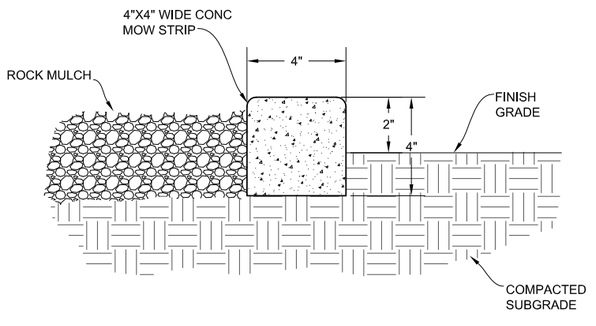
NOT TO SCALE — 3 / --



NOTES:
1. SIZE ANODE LEAD CONDUIT IN ACCORDANCE WITH THE NATIONAL ELECTRICAL CODE. PROVIDE ONE CONDUIT WITH UP TO 15 ANODES, TWO WITH 16 TO 30 ANODES.

ANODE JUNCTION BOX

NOT TO SCALE — 4 / --



NOTES:
1. ALL ROCK MULCH BEDS TO BE SEPARATED FROM NATIVE SEED AREAS WITH CONC CURB MOW STRIP.
2. INSTALL ROCK MULCH TO A MINIMUM 4" DEPTH OVERLYING COMPACTED SUBGRADE; ROCK MULCH TO BE SPECIFIED IN SECTION 02651S.
3. FOR LANDSCAPING PLACEMENT SEE SITE PLAN, SHT CP-01.
4. CONCRETE CURBING AND ROCK MULCH AS SPECIFIED.

ROCK MULCH LANDSCAPING

NOT TO SCALE — 5 / CP-01

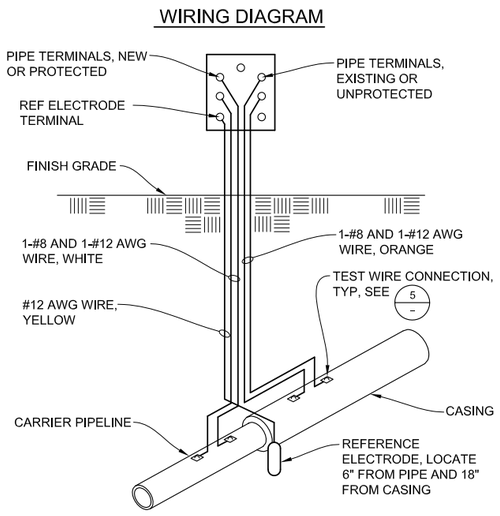
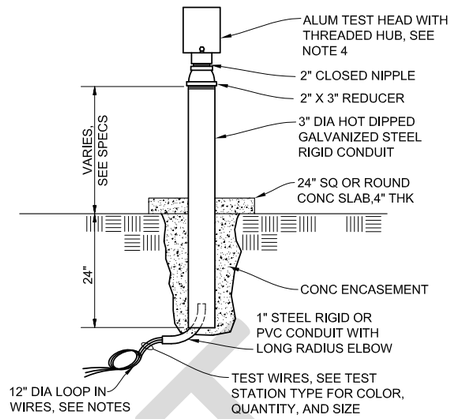
TYPE T TEST STATION 1 --
NOT TO SCALE



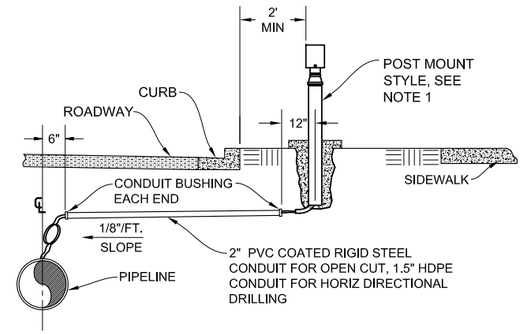
NOTES:
1. SEE TEST STATION STYLE DETAIL AS REQUIRED BY TEST STATION SCHEDULE.
2. WHERE TEST STATION OFFSET IS REQUIRED, SEE 4 --

TYPE C TEST STATION 2 --
NOT TO SCALE



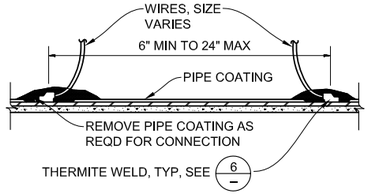
NOTES:
1. TERMINAL QUANTITY AND WIRE CONNECTIONS VARY, SEE TEST STATION TYPE DETAIL.
2. LOOP WIRE AT BASE OF POST TO MINIMIZE WIRE STRESS.
3. COAT THREADS WITH INORGANIC ZINC PRIMER OR COLD GALVANIZING REPAIR COATING.
4. TESTOX SERIES 700 TEST STATION FOR TYPE T, C, AND I TEST STATIONS OR TESTOX SERIES 2000 TEST STATION FOR TYPE F AND A TEST STATIONS WITH THREADED HUBS. SLIP FIT HUBS WILL NOT BE PERMITTED.

POST STYLE, STEEL CONDUIT 3 --
NOT TO SCALE

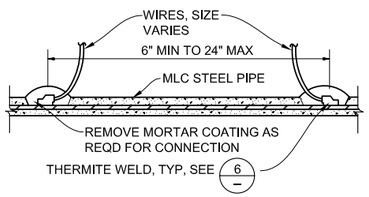


NOTES:
1. INSTALLATION SIMILAR FOR FLUSH STYLE TEST STATIONS.
2. DO NOT CONNECT CONDUIT TO POST STYLE TEST STATION.
3. SEAL BOTH ENDS OF CONDUIT WITH URETHANE FOAM.

TEST STATION ROADWAY OFFSET 4 --
NOT TO SCALE



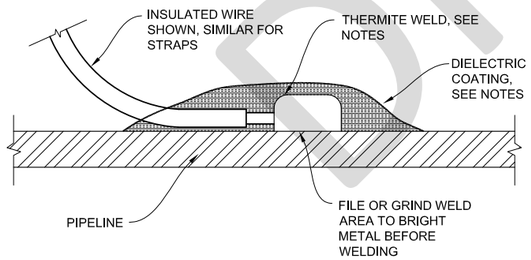
DIELECTRIC COATED STEEL



CCP OR MLC STEEL

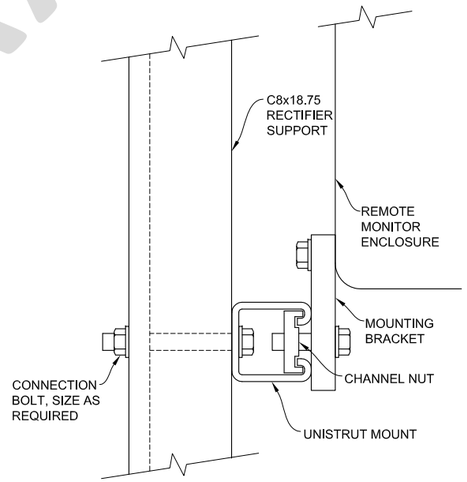
NOTES:
1. PRETENSIONED WIRES ON BARWRAP (CCP) CONCRETE CYLINDER PIPE SHALL NOT BE CUT OR DAMAGED FOR WIRE CONNECTIONS TO PIPE CYLINDER.
2. CEMENT MORTAR COAT ALL CONNECTIONS AND EXPOSED COPPER ON BARWRAP (CCP) PIPE.

TEST WIRE CONNECTION 5 --
NOT TO SCALE



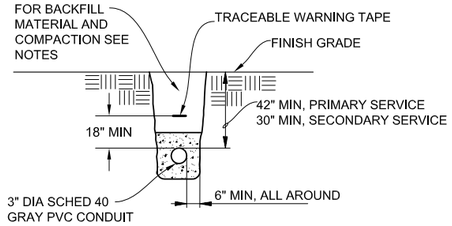
NOTES:
1. MAKE WIRE CONNECTION TO PIPE AT FIELD JOINT WHERE HOLDBACK OCCURS ON PIPELINE COATING, WHERE POSSIBLE.
2. COPPER SLEEVE REQUIRED FOR #2 AWG JOINT BONDS OR FOR #12 AWG OR SMALLER TEST WIRES.
3. WELDER AND CARTRIDGE SIZE VARIES ACCORDING TO PIPE SIZE AND PIPE MATERIAL, CONSULT WELDER MANUFACTURER FOR RECOMMENDED WELDER AND CARTRIDGE.
4. COAT COMPLETED WELDS, EXPOSED COPPER, AND EXPOSED METAL WITH DIELECTRIC COATING AS SPECIFIED FOR PIPELINE MATERIAL ALTERNATIVE.
5. AFTER COATING WELDS, OVERCOAT WITH CEMENT MORTAR WHEN PIPE HAS CEMENT MORTAR COATING OR OVERCOAT.

THERMITE WELD CONNECTION 6 --
NOT TO SCALE



NOTES:
1. UNISTRUT AND HARDWARE TO BE HOT DIPPED GALVANIZED, UNLESS OTHERWISE SPECIFIED.

UNISTRUT MOUNT 7 --
NOT TO SCALE



NOTES:
1. BACKFILL AROUND CONDUIT SHALL BE SELECT MATERIAL IN CONFORMANCE WITH ELECTRICAL UTILITY CONSTRUCTION STANDARDS OR NOTE 2.
2. SELECT MATERIAL FOR BACKFILL SHALL CONSIST OF SAND OR WELL GRADED GRANULAR MATERIAL OF THE FOLLOWING GRADATION:

NO. 200 SIEVE	5%, MAX.
NO. 4 SIEVE	50%, MAX.
3/4" SIEVE	100%

3. BACKFILL SHALL BE COMPACTED TO 90% OF MAXIMUM DENSITY, EXCEPT IN ROADWAYS OR DRIVABLE AREAS, WHERE COMPACTION SHALL BE 95% OF MAXIMUM DENSITY (MODIFIED PROCTOR).
4. CONDUIT SHALL BE LAID USING SOLVENT WELDED JOINTS AND FRP LONG RADIUS SWEEPS, WITH COMBINED BEND NOT GREATER THAN 270 DEGREES.
5. CONDUIT ENDS SHALL BE SEALED TO PREVENT ENTRY OF FOREIGN MATTER AND WATER AND SHALL BE PROVIDED WITH A FLAT 500# PULL LINE, MINIMUM.
6. ALL NON-METALLIC BURIED STRUCTURES SHALL BE PROVIDED WITH TRACEABLE WARNING TAPE FOR THE FULL LENGTH OF THE TRENCH.
7. WHERE ELECTRICAL SERVICE AS SHOWN CONFLICTS WITH ELECTRICAL UTILITY REQUIREMENTS, THE MORE STRINGENT REQUIREMENT WILL APPLY.

STANDARD ELECTRICAL TRENCH 8 CP-01

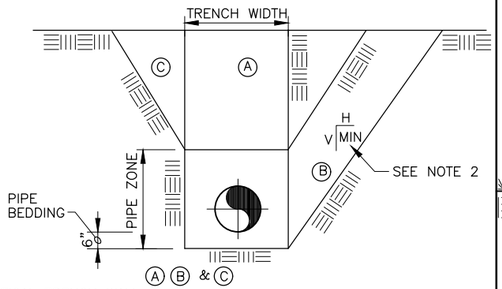
CPS ABANDONMENT DETAILS

SHEET NO. CP-05

EXHIBIT E

H:\BC\ABCA-034\Design\JN2 CP Relocation Detail\.dwg Plotted 7/14/2016 By: Stacy Hilling



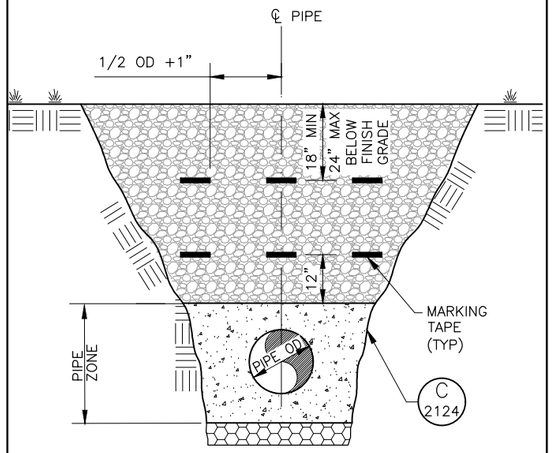
A VERTICAL TRENCH WALL
1. MAX UNSUPPORTED HEIGHT=3.5 FT.
2. FOR DEPTH OVER 3.5 FT SHORING OR SHEATHING REQUIRED.

B SLOPING TRENCH WALL
1. NOT TO BE USED WITHOUT APPROVAL OF ENGINEER.
2. REQUIRES IMPROVED PIPE ZONE BACKFILL OR INCREASE IN PIPE CLASS

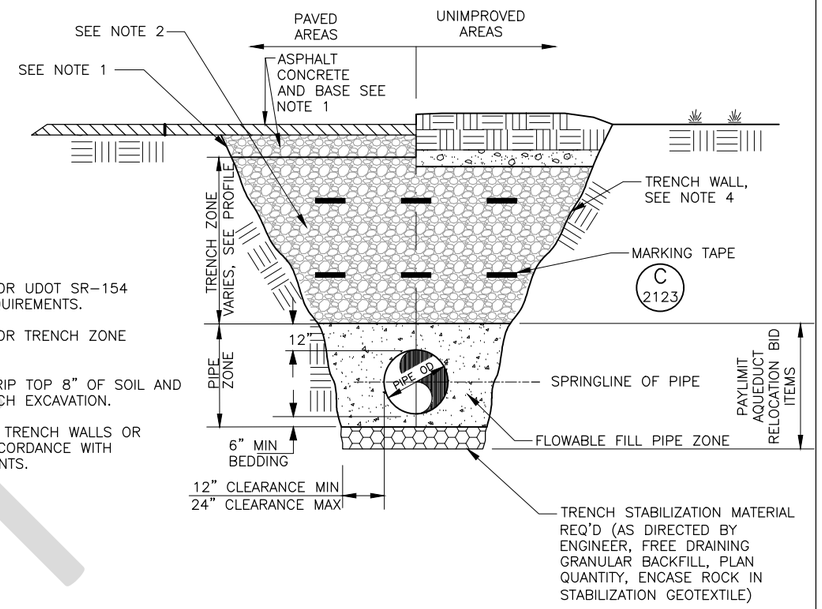
C COMBINATION VERTICAL/SLOPING TRENCH
1. TRENCH IN PIPE ZONE SHALL HAVE VERTICAL WALLS WHERE STABLE SOIL EXISTS.

NOTES:
1. TRENCH EXCAVATIONS TO BE IN ACCORDANCE WITH OSHA SAFETY AND HEALTH STANDARDS FOR CONSTRUCTION. (29 CFR 1926).
2. CONTRACTOR TO PROVIDE SHORING OR TRENCH BOX IN ROADWAY AREAS TO MINIMIZE TRENCH WIDTH.
3. CONTRACTOR TO PROVIDE ALL DEWATERING MEASURES AS REQUIRED.

TYPICAL TRENCH EXCAVATION SECTION
NOT TO SCALE — C 2122

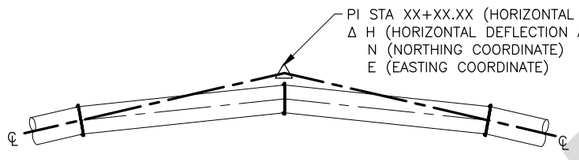


MARKING TAPE PLACEMENT
NOT TO SCALE — C 2123

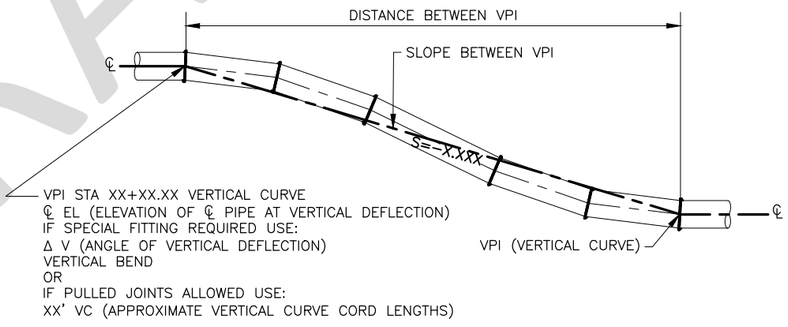


NOTES:
1. SEE ROADWAY DRAWINGS FOR UDOT SR-154 SURFACE RESTORATION REQUIREMENTS.
2. SEE ROADWAY DRAWINGS FOR TRENCH ZONE BACKFILL REQUIREMENTS.
3. IN UNIMPROVED AREAS, STRIP TOP 8" OF SOIL AND STOCKPILE PRIOR TO TRENCH EXCAVATION.
4. CONTRACTOR SHALL SLOPE TRENCH WALLS OR SHORE EXCAVATIONS IN ACCORDANCE WITH CURRENT OSHA REQUIREMENTS.

TYPICAL TRENCH BACKFILL SECTION
NOT TO SCALE — C 2124



HORIZONTAL CURVES



VERTICAL CURVES

NOTES:
1. ALL HORIZONTAL AND VERTICAL CURVES ARE CIRCULAR.
2. HORIZONTAL AND VERTICAL CURVES SHALL BE MADE USING BEVELED JOINTS AND/OR DEFLECTED JOINTS. DO NOT USE COMBINED BEVELED AND DEFLECTED JOINTS.
3. THE MAXIMUM BEVEL ANGLE FOR BEVELED PIPE ENDS SHALL BE 5 DEGREES. SEE SPECIFICATIONS FOR MAXIMUM (NON-BEVELED) JOINT DEFLECTIONS.
4. ALL BEVEL OR DEFLECTION ANGLES SHALL BE EQUALLY DIVIDED THROUGHOUT THE CURVE.
5. FOR COMBINATION VERTICAL AND HORIZONTAL CURVES THE REQUIREMENTS FOR BOTH CONDITIONS SHALL BE COMBINED.
6. REFER TO PLAN AND PROFILE DRAWINGS FOR VERTICAL AND HORIZONTAL CURVE LOCATIONS.
7. 50' PIPE LENGTHS WERE ASSUMED TO DEVELOP VERTICAL CURVE DATA SHOWN ON PLANS. COORDINATE WITH ENGINEER IF DIFFERENT.
8. ALL PROFILE ELEVATIONS ARE SHOWN TO CENTERLINE OF PIPE.
9. REDUCED PIPE SEGMENTS LENGTHS MAY BE USED IN LIEU OF BEVELED OR MITERED JOINTS THROUGH CURVES. COORDINATE SHOP DRAWINGS WITH ENGINEER.

PIPELINE CURVES
NOT TO SCALE — C 2600

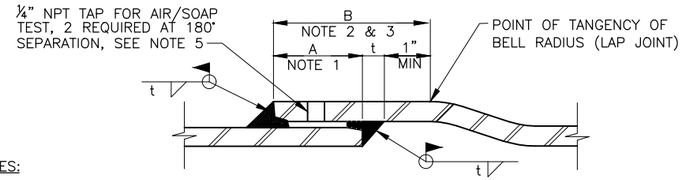
NOTES:

1. CONTRACTOR SHALL CONDUCT AN AIR/SOAP SOLUTION LEAK TEST AT 40 PSI AIR PRESSURE IN ADDITION TO DYE PENETRATE OR MAGNETIC PARTICLE TESTING AS REQUIRED BY SPECIFICATIONS. IF LEAKS ARE DETECTED, THE CONTRACTOR SHALL REPAIR AND RETEST THE WELDS UNTIL THERE ARE NO DEFECTS. PLUG TAPS WITH THREADED PLUG AND SEAL WELD PLUG AT COMPLETION OF TEST AND COAT AND LINE AS SHOWN OR SPECIFIED. TAP HOLES MAY BE ON INSIDE OR OUTSIDE OF JOINT.
2. AFTER INSTALLATION OF JOINT DIELECTRIC COATING, A HOLIDAY TEST SHALL BE COMPLETED AS SPECIFIED BY NACE CERTIFIED SPECIALIST.

LAP WELDED STEEL PIPE JOINT
NOT TO SCALE — C 2708

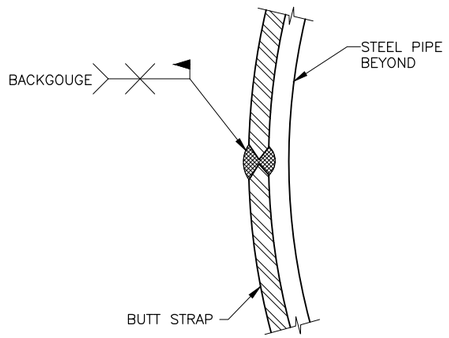
LINING AND COATING NOT SHOWN FOR CLARITY OF JOINT



NOTES:

1. DIMENSION "A" CORRESPONDS TO THE COMPLETED JOINT OVERLAP AFTER WELDING. DIMENSION "A" SHALL BE 3" MINIMUM FOR STANDARD JOINTS. FOR SPECIAL TEMPERATURE CONTROL JOINTS, THE DIMENSION "A" JOINT OVERLAP SHALL BE INCREASED BY 3 INCHES AS FURTHER DISCUSSED IN NOTE 3.
2. FOR STANDARD JOINTS THE MINIMUM DIMENSION "B" SHALL BE AS REQUIRED TO PROVIDE THE MINIMUM OVERLAP DIMENSION "A" AND MAINTAIN THE INDICATED HOLDBACK FOR THE WELD.
3. FOR SPECIAL TEMPERATURE CONTROL JOINTS, THE MINIMUM DIMENSION "B" SHALL BE INCREASED BY AT LEAST 3 INCHES. AT THE TIME OF INSTALLATION AND PRIOR TO WELDING, THE SPIGOT SHALL BE INSERTED INTO THE LENGTHENED BELL TO PROVIDE "A" +3 INCHES MINIMUM JOINT OVERLAP. SEE SPECIFICATIONS SECTION 02612S FOR SPECIAL TEMPERATURE CONTROL JOINT WELDING REQUIREMENTS.
4. FILLET WELDS FOR BELL AND SPIGOT LAP JOINTS SHOWN. FILLET WELDS ON OTHER JOINTS SIMILAR.
5. CONTRACTOR SHALL CONDUCT AN AIR/SOAP SOLUTION LEAK TEST AT 40 PSI AIR PRESSURE IN ADDITION TO DYE PENETRATE OR MAGNETIC PARTICLE TESTING AS REQUIRED BY SPECIFICATIONS. IF LEAKS ARE DETECTED, REPAIR AND RETEST UNTIL THERE ARE NO DEFECTS. PLUG TAPS WITH THREADED PLUG AND SEAL WELD PLUG AT COMPLETION OF TEST AND COAT AND LINE AS SHOWN OR SPECIFIED. TAP HOLES MAY BE ON INSIDE OR OUTSIDE OF JOINT.
6. THE JOINTS SHALL BE FABRICATED AND INSTALLED TO BE WITHIN THE TOLERANCES INDICATED. THE TOLERANCE REQUIREMENTS SHALL APPLY TO BOTH WELDS AND TO BOTH STRAIGHT AND DEFLECTED JOINTS.
7. LAP JOINTS SHALL BE DOUBLE LAP, UNLESS NOTED OTHERWISE. SINGLE LAP JOINTS SHALL BE INSIDE OR OUTSIDE AT CONTRACTORS OPTION.

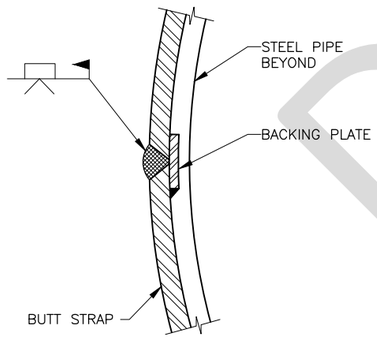
LAP JOINT WELD
NOT TO SCALE — C 2710



NOTES:

1. LININGS AND COATINGS ARE NOT SHOWN FOR CLARITY.

TYPE A
(USED FOR PIPE > 36"ø ACCESS TO BOTH INSIDE AND OUT)

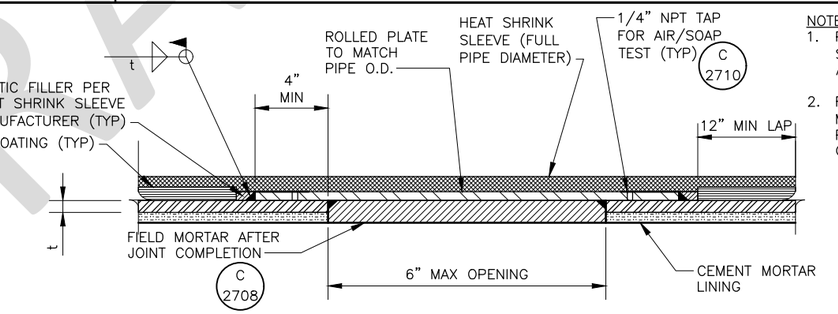


NOTES:

1. LININGS AND COATINGS ARE NOT SHOWN FOR CLARITY.

TYPE B
(USED FOR PIPE ≤ 36"ø ACCESS TO OUTSIDE ONLY)

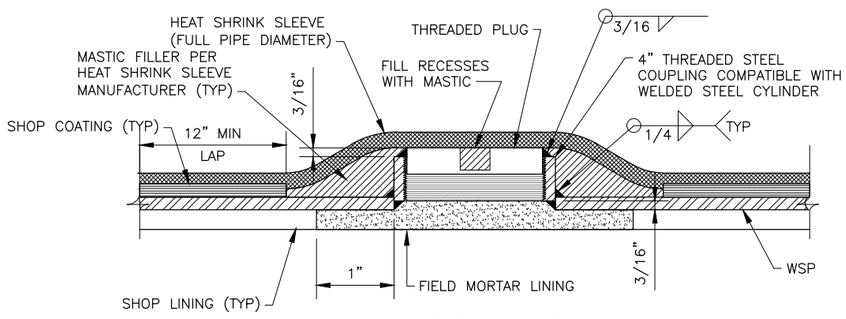
BUTT STRAP WELD
NOT TO SCALE — C 2711



NOTES:

1. PASS THROUGH FOR WELD LEADS MAY BE SPACED NO CLOSER THAN 500' FROM ACCESS MANWAY OUTLETS.
2. ROLLED PLATE THICKNESS SHALL BE MINIMUM OF 1/2" THICK OR EQUAL TO PIPE WALL THICKNESS. WHICHEVER IS GREATER.

ALT 1 (GREATER THAN 4")



ALT 2 (4" & LESS)

PASSHOLE FOR WELD LEEDS
NOT TO SCALE — C 2712

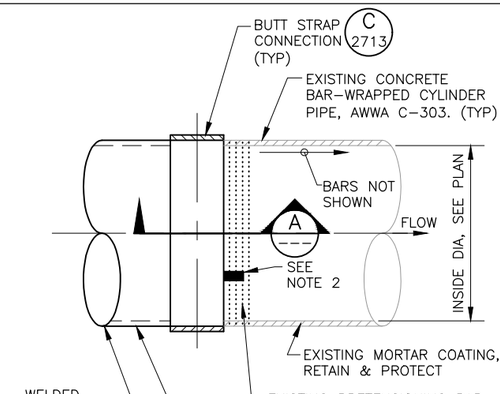
PLAN

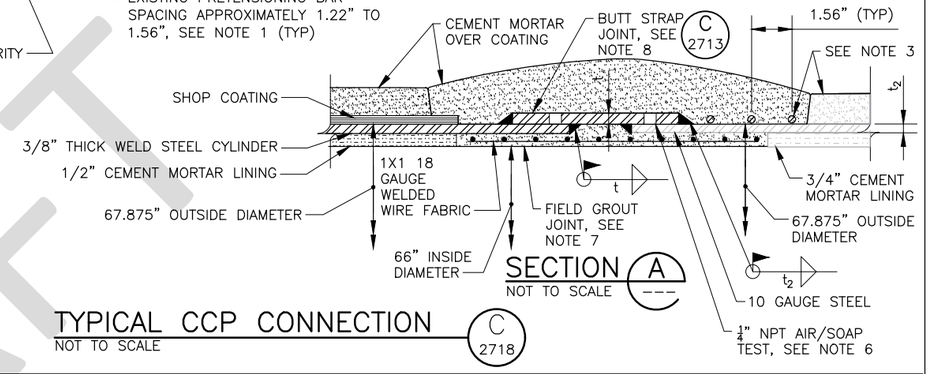
SECTION A
NOT TO SCALE

NOTES:
1. SEQUENCE FOR TESTING NEW CONNECTIONS TO THE EXISTING AQUEDUCT:
   A) INSTALL TEST HEAD ON NEW PIPE.
   B) TEST AND DISINFECT NEW PIPE IN ACCORDANCE WITH SPECIFICATIONS.
   C) COORDINATE WITH JVWCD AND BOR TO REMOVE EXISTING AQUEDUCT FROM SERVICE. DEWATER EXISTING AQUEDUCT AND REMOVE EXISTING PIPE AT CONNECTION LOCATIONS. SEE SPECIFICATIONS.
   D) CONNECT THE EXISTING PIPE TO THE NEW PIPE USING CLOSURE SECTIONS AS SHOWN, PER PLAN.
   E) TEST JOINTS AS REQUIRED.
   F) INSTALL FIELD APPLIED LININGS AND COATINGS AT THE CLOSURE SECTION JOINTS.
   G) DISINFECT CONNECTION FITTING AND SURROUNDING AQUEDUCT. COORDINATE WITH JVWCD TO RETURN AQUEDUCT TO SERVICE.
   H) CONCRETE THRUST COLLAR TO CURE MINIMUM 48 HRS PRIOR TO RETURNING AQUEDUCT TO SERVICE
2. VERIFY OD, GEOMETRY AND ALIGNMENT OF EXISTING PIPE PRIOR TO ORDERING CLOSURE PIECES.
3. FIELD LOCATION AND CONNECTION DETAILS SHALL BE INCLUDED WITH THE SHOP DRAWINGS SUBMITTALS. FOLLOWING THE INSTALLATION OF THE CLOSURE SECTION, THE CONTRACTOR SHALL BACKFILL THE NEW AND EXISTING PIPELINE AND RESTORE THE GROUND SURFACE.
4. SOUTH AQUEDUCT CONNECTION SHOWN. SIMILAR FOR NORTH AQUEDUCT CONNECTION.

FINAL TIE-IN CONNECTION TO EXISTING AQUEDUCT
NOT TO SCALE — C 2717



NOTES:
1. DO NOT CUT ANY PRETENSIONING BARS UNTIL NOTE 2 IS COMPLETED.
2. REMOVE CONCRETE COATING TO EXPOSE THREE COMPLETE COILS OF PRETENSIONING BARS, AND CAREFULLY TACK WELD A 6" STEEL BAR ACROSS THE PRETENSIONED BARS AND CAREFULLY TACK WELD PRETENSIONED BARS TO STEEL CYLINDER AT 10-INCH SPACING ALL AROUND PRIOR TO CUTTING PIPE. WHEN WELDING TAKE CARE NOT TO BURN THROUGH EXISTING PRETENSIONED BARS AND STEEL CYLINDERS.
3. REPAIR DAMAGED MORTAR LINING AND COATING TO NEW CONDITION.
4. DEWATERING OF PIPELINE TO BE SCHEDULED BY OWNER WITH DATES ESTABLISHED FOR ALLOWABLE CUT DURING TIME NOTED IN CONTRACT DOCUMENT. CONTRACTOR SHALL BE PREPARED TO MANAGE MINOR AMOUNTS OF WATER IN PIPELINE AFTER DEWATERING.
5. DISINFECT IN ACCORDANCE WITH APWA C651.
6. CONDUCT AN AIR/SOAP SOLUTION LEAK TEST AT 40 PSI AIR PRESSURE IN ADDITION TO DYE PENETRATE OR MAGNETIC PARTICLE TESTING AS REQ'D BY SPECIFICATIONS. IF LEAKS ARE DETECTED, THE CONTRACTOR SHALL REPAIR AND RETEST THE WELDS UNTIL THERE ARE NO DEFECTS. PLUG TAPS WITH THREADED PLUG AND SEAL WELD PLUG AT COMPLETION OF TEST AND COAT AND LINE AS SHOWN OR SPECIFIED. PROVIDE TWO TAP HOLES AT 180°.
7. GROUT FOR JOINT LINING SHALL BE ONE PART CEMENT TO TWO PARTS SAND AND SUFFICIENT WATER FOR DRY-PACK CONSISTENCY.
8. WHERE CONNECTING TO EXISTING CCP, BUTT STRAP TO BE $\frac{1}{4}$" THICK.

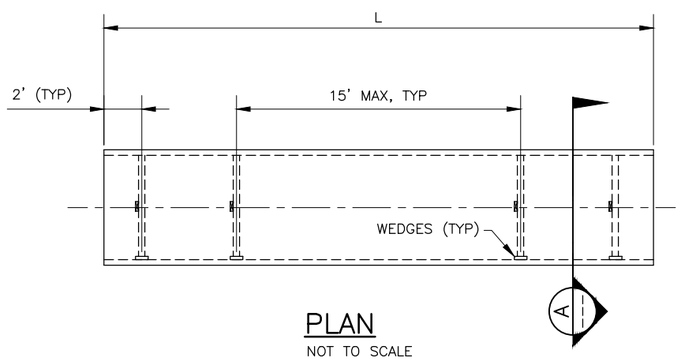


SECTION A
NOT TO SCALE

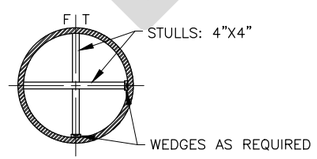
TYPICAL CCP CONNECTION
NOT TO SCALE — C 2718

NOTES:

1. STULLING IS DESIGNED FOR HAULING PURPOSE ONLY. PERFORMANCE OF PIPE BRACING USED DURING INSTALLATION SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR.

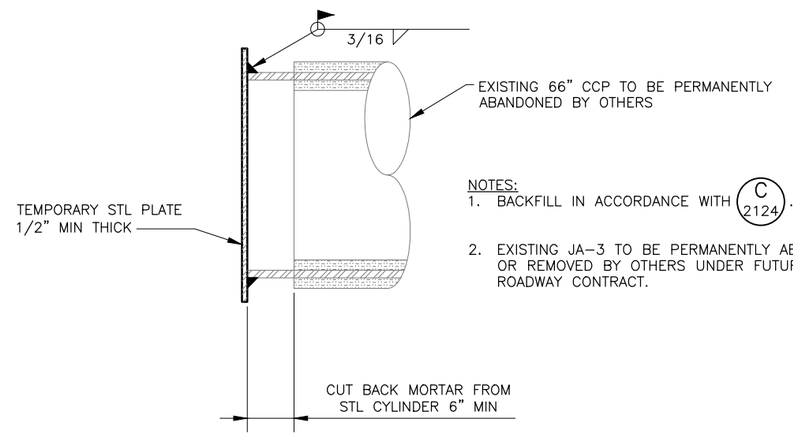


PLAN
NOT TO SCALE



SECTION A
NOT TO SCALE

WSP TEMPORARY BRACING LOCATIONS
NOT TO SCALE — C 2853



NOTES:
1. BACKFILL IN ACCORDANCE WITH C 2124.
2. EXISTING JA-3 TO BE PERMANENTLY ABANDONED OR REMOVED BY OTHERS UNDER FUTURE ROADWAY CONTRACT.

TEMPORARY STEEL COVER PLATE
NOT TO SCALE — C 2872

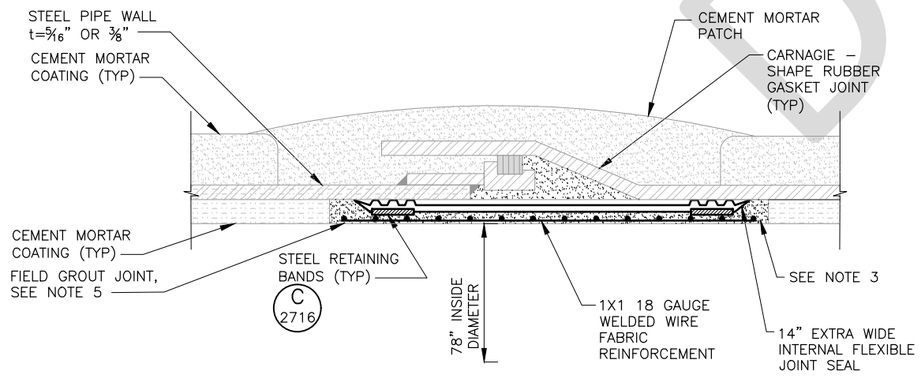
NOTES:
1. DETAIL REQ'D ONLY WHERE EXISTING JOINTS ARE DAMAGED BY ROADWAY CONSTRUCTION WORK BY OTHERS. PAYMENT ON UNIT BASIS FOLLOWING POST–CONSTRUCTION JOINT TESTING, SEE SPECIFICATIONS.
2. REMOVE CEMENT MORTAR LINING TO A NEAT LINE AND GRIND AND REPAIR ANY DAMAGE ON PIPE WALL, AND CLEAN AND PREPARE JOINT PRIOR TO INSTALLING BUTT STRAP.
3. CONDUCT AN AIR/SOAP SOLUTION LEAK TEST AT 40 PSI AIR PRESSURE IN ADDITION TO DYE PENETRATE OR MAGNETIC PARTICLE TESTING AS REQ'D BY SPECIFICATIONS. IF LEAKS ARE DETECTED, THE CONTRACTOR SHALL REPAIR AND RETEST THE WELDS UNTIL THERE ARE NO DEFECTS. PLUG TAPS WITH THREADED PLUG AND SEAL WELD PLUG AT COMPLETION OF TEST AND COAT AND LINE AS SHOWN OR SPECIFIED. PROVIDE TWO TAP HOLES AT 180°.
4. GROUT FOR JOINT LINING SHALL BE ONE PART CEMENT TO TWO PARTS SAND AND SUFFICIENT WATER FOR DRY–PACK CONSISTENCY.

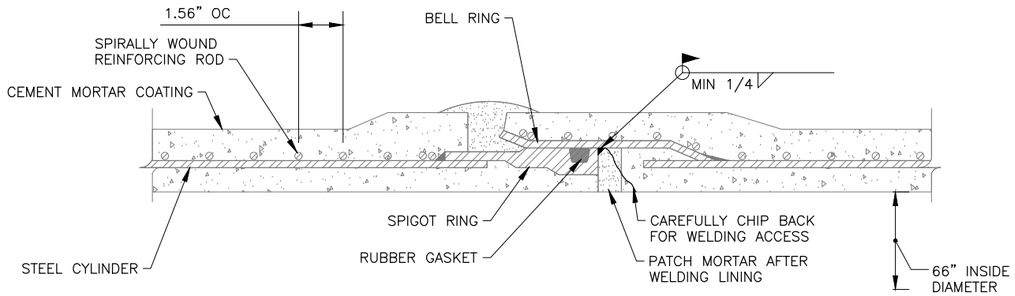
INTERIOR BUTTSTRAP JOINT FOR STEEL PIPE
NOT TO SCALE — C 2951

NOTES:
1. FLEXIBLE JOINT SEALS PROVIDED BY UDOT FOR INSTALLATION BY CONTRACTOR.
2. SEALS AND RETAINING BANDS BASED UPON WEKO–SEAL INTERNAL JOINT SEALS, MILLER PIPELINE CO.
3. REMOVE MORTAR LINING AT JOINT SEALS 3" BEYOND EITHER SIDE OF THE SEAL POSITION. REMOVE DIRT, SCALE AND DEBRIS FROM STEEL PIPE WALL WHERE THE SEALS WILL BE INSTALLED.
4. AQUAD EPOXY SHALL BE APPLIED ON EACH SIDE OF THE SPIRAL WELDS WHERE RETAINING BANDS INTERSECT TO CREATE A FEATHERED SMOOTH TRANSITION AND GOOD SEALING SURFACE.
5. AFTER REMOVAL OF THE FLEXIBLE JOINT SEAL, REPAIR MORTAR LINING USING ONE PART CEMENT TO TWO PARTS SAND AND SUFFICIENT WATER FOR DRY PACK CONSISTENCY WITH EMBEDDED WIRE REINFORCING SIMILAR TO DETAIL C 2951 .



FLEXIBLE INTERNAL JOINT SEAL FOR STEEL PIPE
NOT TO SCALE — C 2954

NOTES:
1. PREPARE JOINT FOR WELDING BY CAREFULLY CHIPPING BACK SUFFICIENT MORTAR LINING FOR WELDING ACCESS.
2. STEEL SURFACE TO BE WELDED SHALL BE DRY, CLEAN AND FREE FROM CEMENT MORTAR, GREASE, SCALE OR ANY DEBRIS THAT COULD PREVENT PROPER WELDING.
3. PROVIDE ADEQUATE VENTILATION BEFORE ATTEMPTING WELDING OF THE JOINT.
4. PLACE WELD IN TWO PASSES USING SKIP WELDING AND COOLING WITH A DAMP RAG TO PREVENT EXCESSIVE SMOKE IN THE PIPE THAT COULD BE PRODUCED FROM BURNING THE RUBBER GASKET.
5. WHEN WELDING IS COMPLETED, CLEAN INTERIOR JOINT RECESS AND REPAIR WITH CEMENT MORTAR. SIMILAR TO DETAIL C 2951 .



INTERIOR WELDED JOINT FOR CCP
NOT TO SCALE — C 2956

WELBY JACOB WATER USERS COMPANY
MASTER UTILITY AGREEMENT

THIS MASTER UTILITY AGREEMENT, made and entered into this _____day of_____, 20_____, by and between the **Utah Department of Transportation**, ("UDOT"), and **Welby Jacob Water Users Company**, a local special service district of the State of Utah, ("District") each as ("Party") and jointly as ("Parties").

MASTER UTILITY AGREEMENT

RECITALS

WHEREAS, UDOT is preparing to request proposals for and award a design-build contract for the highway project identified as Project Number S-0154(12)11, 4 Interchanges on Bangerter Highway in Salt Lake County, Utah, ("Project"); and

WHEREAS, the design-build contractor will complete the design and administer construction of the Project ("Design-Builder"); and

WHEREAS, UDOT has identified District facilities within the limits of the Project which may necessitate the relocation, protection, or adjustment of the facilities, ("Utility Work"); and

WHEREAS, the District desires for the Design-Builder to design and perform the Utility Work on the District's facilities necessitated by the Project; and

WHEREAS, the District will perform the necessary design review and inspection to accommodate the Project; and

WHEREAS, for the purpose of expediting any required Utility Work and reimbursement, the Parties are entering into this Project Master Utility Agreement with the understanding that future supplemental agreements to this Agreement will be entered into covering the Utility Work to be accomplished by UDOT at specific Project locations.

THIS AGREEMENT is made to set out the terms and conditions where under the Utility Work shall be performed.

DRAFT

AGREEMENT

NOW THEREFORE, the Parties agree as follows:

1. PROJECT RESPONSIBLE FOR COST

In accordance with Utah Code § 72-6-116(3)(a)(ii), UDOT is responsible for 100% of the cost of the Utility Work of District's facilities for those costs that comply with Utah Administrative Code R930-8.

2. CONTACT INFORMATION

UDOT's Project Representative is Alana Spendlove, UDOT Project Utility and Railroad Leader, telephone number (801) 887-3462, and e-mail aspendlove@utah.gov.

UDOT's Resident Engineer for 5400 South and 7000 South interchanges is Bryan Chamberlain, telephone number (801) 887-3405, and e-mail bchamberlain@utah.gov, or their designated representative, as assigned.

UDOT's Resident Engineer for 9000 South and 11400 South interchanges is Ken Talbot, telephone number (801) 360-8750, and e-mail kentalbot@utah.gov, or their designated representative, as assigned.

UDOT's Field Representative contact person will be identified in subsequent supplemental agreements.

District's contact person is Darryl Lehmitz, telephone number (801) 718-3327, and e-mail darryllehmitz@yahoo.com.

After awarding the Project, UDOT will provide the District with the Design Builder contact information, hereinafter referred to as "Design-Builder Project Representative".

3. AUTHORIZATION FOR DESIGN WORK

In order to facilitate coordination and obtain technical information about the District's facilities and requirements for inclusion in this Agreement and the Request for Proposals, UDOT gave the District authorization for preliminary design engineering on August 9, 2016.

4. SUBSURFACE UTILITY ENGINEERING

UDOT has performed Subsurface Utility Engineering (SUE) within the limits of the Project. Additional SUE work to determine the precise location of underground facilities at specific, critical locations on the Project will be reviewed with the District.

DRAFT

5. PROJECT COORDINATION

The District requested that UDOT include items of Utility Work for relocating and adjusting District's facilities in the Project.

During the development of the Project design, the District and UDOT, along with its Design-Builder, shall consult as necessary in an effort to determine if conflicts with the District's facilities can be avoided. If Utility Work for the District's facilities is required by the Project, UDOT will be responsible to identify the conflicts and to design and construct the Utility Work of the District's facilities. The District will perform the necessary design reviews prior to the start of Utility Work. UDOT's Project Representative will be responsible for coordinating with other utility companies as it relates to District's facilities.

6. DISTRICT REQUIREMENTS

UDOT will comply with the following District Utility Work requirements**:**

a. The District will require …
b. The District facilities shall remain operational between the months April through October.
c. UDOT will supply as-constructed plans, in _____ format, upon completion of any required Utility Work including betterment work.

7. UDOT TO DESIGN AND CONSTRUCT DISTRICT'S UTILITY WORK

UDOT will schedule and meet with the District to review the design and scheduling of the Utility Work for the District's facilities at specific locations on the Project to ensure maximum lead time for advance order of materials and work force scheduling.

UDOT will design the Utility Work in accordance with District's standards regularly followed by the District in its own work and not considered a betterment. In the event of a conflict between UDOT and District standards, the higher standard will be applied.

a. The District's standards marked EXHIBIT "A" that is incorporated by reference.
b. The District's encroachment applications is marked EXHIBIT "B" that is incorporated by reference.
c. UDOT will secure permits required for Utility Work of District's facilities.

8. RIGHT-OF-WAY

Any easements or replacement right-of-way required in conjunction with the Utility Work of District's facilities will be acquired by UDOT in accordance with the requirements of Utah Administrative Code R930-8.

9. BETTERMENT WORK

DRAFT

If the District desires to include betterment work in the Project at any specific location UDOT may agree to the betterment providing the difference in costs between the functionally equivalent required Utility Work and the District's desired betterment work that is not required by the Project shall be at the sole cost of the District and the betterment work can be accommodated without delaying UDOT's Project. The betterment work will be addressed by separate supplemental agreement between UDOT and the District.

Once a Design-Builder has been selected by UDOT, any betterment work request will be negotiated directly with the Design-Builder. However, it is at UDOT's sole discretion to approve the betterment work.

10. SUPPLEMENTAL AGREEMENTS

UDOT and the District shall enter into supplemental agreements to cover Utility Work at specific Project locations. As part of the supplemental agreement, UDOT will provide design plans and Utility Work schedules for review and approval by the District prior to start of the Utility Work. A copy of the format of the proposed supplemental agreement is marked EXHIBIT "B" that is incorporated by reference.

The District will require a 2 week review and approval period for any final supplemental agreement submitted to the District by UDOT.

In the event there are changes in the scope of the Utility Work, extra Utility Work, or changes in the planned Utility Work covered by a supplemental agreement, a modification to the supplemental agreement approved in writing by the Parties is required prior to the start of Utility Work on the changes or additions.

11. UDOT TO NOTIFY DISTRICT BEFORE BEGINNING UTILITY WORK

UDOT will notify the District at least 2 business days in advance of beginning any Utility Work covered by any supplemental agreements hereto, to allow the District time to schedule an inspector to be present during the Utility Work. Subsequent notification of when and where Utility Work will be performed will be given on a day-to-day basis.

12. DISTRICT TO NOTIFY UDOT

District's personnel shall notify UDOT's Field Representative upon arriving and leaving the Project site for verification of inspecting Utility Work. District's personnel will comply with all applicable OSHA and Project safety requirements while within the Project limits.

13. INSPECTION

The District shall provide on-call engineering support by District's engineer or appropriate representative for design review, schedule coordination, or to correct or clarify issues during Utility Work, and to perform the necessary inspection on the District's facilities installed by UDOT.

DRAFT

a. The District's engineer and/or inspector shall work with and through UDOT's Project Representative and shall give no orders directly to UDOT's Design-Builder unless authorized in writing to do so. UDOT will accomplish the Utility Work covered herein on District's facilities in accordance with the plans and specifications provided and/or approved by the District, including changes or additions to the plans and specifications, which are approved by the Parties hereto.
b. The District shall immediately notify UDOT's Project Representative and the Design-Builder Project Representative of any deficiencies in the Utility Work on the District's facilities. The District shall follow up with written detail to UDOT's Project Representative and the Design-Builder Project Representative of its findings within 24-hours of making its initial notification.
c. UDOT will respond to District's concerns within 24-hours of written notification.
d. The District, through its inspection of the Utility Work, will provide UDOT's Project Representative with information covering any problems or concerns the District may have with acceptance of the facilities upon completion of the Utility Work.
e. Any periodic plan and specification review or construction inspection performed by UDOT arising out of the performance of the Utility Work does not relieve the District of its duty in the performance of the Utility Work or to ensure compliance with acceptable standards.

14. DAILY RECORDKEEPING

UDOT's Field Representative will keep daily records of the inspection performed by the District. Daily inspection records will be in duplicate on a form to be prepared by the District or UDOT. The type of form to be used shall be preapproved by UDOT's Contracts, Compliance and Certification Manager. The inspection records shall be signed by UDOT's Field Representative, and the District or its authorized representatives. Copies of the inspection records shall be retained by the parties to this Agreement.

15. REIMBURSEMENT

UDOT will not reimburse the District for costs incurred by District personnel for design review, observation, inspection, and operation of valves performed as part of their regularly assigned duties. Should it become necessary for the District to procure outside services to perform design review, observation, or inspection to accommodate UDOT's Utility Work and Project schedule, the District shall notify UDOT. Upon concurrence by UDOT, a supplemental agreement for the cost of the services will be executed at which time the District may procure outside services through appropriate solicitation.

16. SUBMITTAL OF ITEMIZED BILLS

The District shall submit itemized bills covering the actual costs incurred for outside services to perform design review, oversight, and inspection work covered by supplemental agreements to UDOT's Contracts and Compliance Specialist:

UDOT Contracts and Compliance Specialist

DRAFT

Utah Department of Transportation
PO Box 141510
SLC, UT 84114-1510

Itemized bills shall bear the Project and supplemental agreement numbers, supporting sheets, and a complete billing statement of all actual costs incurred, following the order of the items in the detailed estimates contained in the supplemental agreement and be submitted to UDOT within 60 days following completion of outside services by the District on the Project. Otherwise, previous payments to the District may be considered final, except as agreed to between the Parties in advance.

UDOT will reimburse the District within 60 days after receipt of the billings, but only for items complying fully with the provisions of Utah Administrative Code R930-8. Failure on the part of the District to submit final billings within 6 months of the completion of outside services will result in UDOT's disallowance of that portion of outside services performed by the District.

17. SALVAGED MATERIALS

All materials from District's existing facilities which are recovered by UDOT while performing the Utility Work and not reused on this Project shall become the property of the Design-Builder unless otherwise agreed to in advance by the Parties hereto.

18. RIGHT TO AUDIT

UDOT and the Federal Highway Administration shall have the right to audit all cost records and accounts of he District pertaining to this Project in accordance with the auditing procedure of the Federal Highway Administration and 23 C.F.R. § 645, subpart A. Should this audit disclose that the District has been underpaid, the District will be reimbursed by UDOT within 60 days upon submission of additional billing to cover the underpayment. Should this audit disclose that the District has been overpaid, the District will reimburse UDOT within 60 days of notification of audit findings in the amount of the overpayment. For purpose of audit the District is required to keep and maintain its records of outsides services covered herein for a minimum of 3 years after final payment is received by the District from UDOT.

19. ACCEPTANCE AND MAINTENANCE

Upon completion of the Utility Work of District facilities by UDOT, the District will accept, own, and maintain its own facilities. The District shall be the sole owner of the facilities upon completion of the Project unless otherwise agreed to by the Parties. To the extent it may lawfully do so, District further agrees to relieve UDOT from any responsibility or liability that may result from its new facilities or the operation thereof.

20. ACCESS

It is understood that access for maintenance and servicing of District's facilities located on the right-of-way of the Project will be allowed only by permit issued by UDOT to the District, and that the District will obtain the permit and abide by conditions thereof for policing and other controls in conformance with Utah Administrative Code R930-7.

DRAFT

21. **INDEMNIFICATION**

UDOT and the District are both governmental entities subject to the Governmental Immunity Act. Each Party agrees to indemnify, defend, and save harmless the other from and against all claims, suits and costs, including attorneys' fees for injury or damage of any kind, arising out of its negligent acts, errors or omissions of its officers, agents, contractors or employees in the performance of this Agreement, and from and against all claims, suits, and costs, including attorneys' fees for injury or damage of any kind. Nothing in this paragraph is intended to create additional rights to third parties or to waive any of the provisions of the Governmental Immunity Act. The obligation to indemnify is limited to the dollar amounts set forth in the Governmental Immunity Act, provided the Act applies to the action or omission giving rise to the protections in this paragraph. The indemnification in this paragraph shall survive the expiration or termination of this Agreement.

22. **MISCELLANEOUS**

a. Each Party agrees to undertake and perform all further acts that are reasonably necessary to carry out the intent and purpose of this Agreement at the request of the other Party.

b. This Agreement in no way creates any type of agency relationship, joint venture, or partnership between UDOT and District.

c. The failure of either Party to insist upon strict compliance of any of the terms and conditions, or failure or delay by either Party to exercise any rights or remedies provided in this Agreement, or by law, will not release either Party from any obligations arising under this Agreement.

d. This Agreement shall be deemed to be made under and shall be governed by the laws of the State of Utah in all respects. Each person signing this Agreement warrants that the person has full legal capacity, power and authority to execute this Agreement for and on behalf of the respective Party and to bind such Party. This Agreement may be executed in one or more counterparts, each of which shall be an original, with the same effect as if the signatures were made upon the same instrument. This Agreement may be delivered by facsimile or electronic mail.

WELBY JACOB WATER USERS COMPANY
SUPPLEMENTAL AGREEMENT NO. ___

Supplement to UDOT Finance No. _____

THIS SUPPLEMENTAL AGREEMENT, made and entered into this _____ day of _____, 20____, **Utah Department of Transportation**, ("UDOT"), and **Welby Jacob Water Users Company**, a local special service district of the State of Utah, ("District") each as ("Party") and jointly as ("Parties").

The parties hereto entered in to a Master Utility Agreement (MUA) dated _____, UDOT Finance No. _____. All the terms of the Master Utility Agreement remain in full force and effect unless otherwise specified herein.

The Parties agree as follows:

1. UDOT will perform the following described Utility Work in accordance with the terms and conditions of the MUA:

   a. Description of Utility Work to be performed, including proposed location, described in Exhibit "A" that is incorporated by reference: (Plan Sheets Attached)
   b. The District requirements as shown in the MUA – District Requirements, are modified as follows:
      i.
   c. Anticipated duration of Utility Work:
   d. Total estimated cost of District's (100% reimbursable) outside services: (Detailed Estimate Attached)

2. UDOT will notify the District's Project Representative, Darryl Lehmitz, telephone number (801) 718-3327, and e-mail darryllehmitz@yahoo.com at least 48 hours in advance of beginning the Utility Work covered herein, or in accordance with the specific terms of the MUA, as applicable.

CITY OF WEST JORDAN
MASTER UTILITY AGREEMENT

THIS MASTER UTILITY AGREEMENT, made and entered into this _____day of_____, 20_____, by and between the **Utah Department of Transportation**, ("UDOT"), and the **City of West Jordan**, a Municipal Corporation of the State of Utah, ("City") each as ("Party") and jointly as ("Parties").

RECITALS

WHEREAS, UDOT is preparing to request proposals for and award a design-build contract for the highway project identified as Project No. S-0154(12)11, 4 Interchanges on Bangerter Highway in Salt Lake County, Utah, ("Project"); and

WHEREAS, the design-build contractor will complete the design and administer construction of the Project ("Design-Builder"); and

WHEREAS, UDOT has identified City facilities within the limits of the Project which may necessitate the relocation, protection, or adjustment of the facilities, ("Utility Work"); and

WHEREAS, the City desires for the Design-Builder to design and perform the Utility Work on the City's facilities necessitated by the Project; and

WHEREAS, the City will perform the necessary design review and inspection to accommodate the Project; and

WHEREAS, for the purpose of expediting any required Utility Work and reimbursement, the Parties are entering into this Project Master Utility Agreement with the understanding that future supplemental agreements to this Agreement will be entered into covering the Utility Work to be accomplished by UDOT at specific Project locations.

THIS AGREEMENT is made to set out the terms and conditions where under the Utility Work shall be performed.

DRAFT

AGREEMENT

NOW THEREFORE, the Parties agree as follows:

1. PROJECT RESPONSIBLE FOR COST

In accordance with Utah Code § 72-6-116(3)(a)(ii), UDOT is responsible for 100% of the cost of the Utility Work of City's facilities for those costs that comply with Utah Administrative Code R930-8.

2. CONTACT INFORMATION

UDOT's Project Representative is Alana Spendlove, UDOT Project Utility and Railroad Leader, telephone number (801) 887-3462, and e-mail aspendlove@utah.gov.

UDOT's Resident Engineer for 5400 South and 7000 South interchanges is Bryan Chamberlain, telephone number (801) 887-3405, and e-mail bchamberlain@utah.gov, or their designated representative, as assigned.

UDOT's Resident Engineer for 9000 South and 11400 South interchanges is Ken Talbot, telephone number (801) 360-8750, and e-mail kentalbot@utah.gov, or their designated representative, as assigned.

UDOT's Field Representative contact person will be identified in subsequent supplemental agreements.

City's contact person is David Murphy, telephone number (801) 569-5074, and e-mail davidm@wjordan.com.

After awarding the Project, UDOT will provide the City with the Design Builder contact information, hereinafter referred to as "Design-Builder Project Representative".

3. AUTHORIZATION FOR DESIGN WORK

In order to facilitate coordination and obtain technical information about the City's facilities and requirements for inclusion in this Agreement and the Request for Proposals, UDOT gave the City authorization for preliminary design engineering on April 26, 2016.

4. SUBSURFACE UTILITY ENGINEERING

UDOT has performed Subsurface Utility Engineering (SUE) within the limits of the Project. Additional SUE work to determine the precise location of underground facilities at specific, critical locations on the Project will be reviewed with the City.

DRAFT

5. PROJECT COORDINATION

The City requested that UDOT include items of Utility Work for relocating and adjusting City's facilities in the Project.

During the development of the Project design, the City and UDOT, along with its Design-Builder, shall consult as necessary in an effort to determine if conflicts with the City's facilities can be avoided. If Utility Work for the City's facilities is required by the Project, UDOT will be responsible to identify the conflicts and to design and construct the Utility Work of the City's facilities. The City will perform the necessary design reviews prior to the start of Utility Work. UDOT's Project Representative will be responsible for coordinating with other utility companies as it relates to City's facilities.

6. CITY REQUIREMENTS

UDOT will comply with the following City Utility Work requirements**:**

a. The City will require 14-day advance shut down notification for all water and sewer connections. A copy of the City's Water System Disruption of Service Approval Process is marked Exhibit "A" that is incorporated by reference.
   i. Notifications shall include, but are not limited to the following:
      1. Scope and schedule of work.
      2. City water, storm drain, and sewer system activities.
      3. City 16-inch water feed connection activities as it relates to the BOR Jordan Aqueduct Reach 2 & 3.
      4. Lateral connections to homes, businesses, and service retirements at all property takes and/or incidental work activities.
   ii. Allow 14-days for review and approval from the City.

b. UDOT will supply as-constructed plans, in AutoCAD version 16 format specified by the City, upon completion of any required Utility Work including betterment work.

c. Coordinate Project Work and Maintenance of Traffic activities/requirements for City's independent project for its 2017 Master Plan Sewer Improvements crossing Bangerter Highway at 3200 West.
   i. City shall request a permit from UDOT prior to beginning its 2017 Master Plan Sewer Improvement work.

d. Approval of plans in an executed Storm Drain Agreement(s) prior to contributing temporary and permanent Project storm drain into City system.

7. UDOT TO DESIGN AND CONSTRUCT CITY'S UTILITY WORK

UDOT will schedule and meet with the City to review the design and scheduling of the Utility Work for the City's facilities at specific locations on the Project to ensure maximum lead time for advance order of materials and work force scheduling.

a. UDOT will design the Utility Work in accordance with City's standards regularly followed by the City in its own work and not considered a betterment. In the event of a conflict between UDOT and City standards, the higher standard will be applied.

DRAFT

i. A copy of the City's standards can be found at http://www.wjordan.com/Engineering.aspx?pgID=3.7.1 that is incorporated by reference.

b. UDOT will secure permits required for Utility Work of City's facilities.
   i. A copy of the City's Encroachment Permit is marked Exhibit "B" that is incorporated by reference.
   ii. A copy of the City's Demolition Permit is marked Exhibit "C" that is incorporated by reference.

8. **RIGHT-OF-WAY**

Any easements or replacement right-of-way required in conjunction with the Utility Work of City's facilities will be acquired by UDOT in accordance with the requirements of Utah Administrative Code R930-8.

9. **BETTERMENT WORK**

City Betterment Work is described in attached Exhibit "D" that is incorporated by reference.

City Aesthetics and Landscaping Betterment Work is described in attached Exhibit "E" that is incorporated by reference.

If the City desires to include additional betterment work in the Project at any specific location UDOT may agree to the betterment providing the difference in costs between the functionally equivalent required Utility Work and the City's desired betterment work that is not required by the Project shall be at the sole cost of the City and the betterment work can be accommodated without delaying UDOT's Project. The betterment work will be addressed by separate supplemental agreement between UDOT and the City.

Once a Design-Builder has been selected by UDOT, any betterment work request will be negotiated directly with the Design-Builder. However, it is at UDOT's sole discretion to approve the betterment work.

10. **SUPPLEMENTAL AGREEMENTS**

UDOT and the City shall enter into supplemental agreements to cover Utility Work at specific Project locations. As part of the supplemental agreement, UDOT will provide design plans and Utility Work schedules for review and approval by the City prior to start of the Utility Work. A copy of the format of the proposed supplemental agreement is marked EXHIBIT "F" that is incorporated by reference.

The City will require a 2 week review and approval period for any final supplemental agreement submitted to the City by UDOT. The City does not require council review for supplemental agreement approval.

In the event there are changes in the scope of the Utility Work, extra Utility Work, or changes in the planned Utility Work covered by a supplemental agreement, a modification to the supplemental

DRAFT

agreement approved in writing by the Parties is required prior to the start of Utility Work on the changes or additions.

11. UDOT TO NOTIFY CITY BEFORE BEGINNING UTILITY WORK

UDOT will notify the City at least 2 business days in advance of beginning any Utility Work covered by any supplemental agreements hereto, to allow the City time to schedule an inspector to be present during the Utility Work. Subsequent notification of when and where Utility Work will be performed will be given on a day-to-day basis.

12. CITY TO NOTIFY UDOT

City's personnel shall notify UDOT's Field Representative upon arriving and leaving the Project site for verification of inspecting Utility Work. City's personnel will comply with all applicable OSHA and Project safety requirements while within the Project limits.

13. INSPECTION

The City shall provide on-call engineering support by City's engineer or appropriate representative for design review, schedule coordination, or to correct or clarify issues during Utility Work, and to perform the necessary inspection on the City's facilities installed by UDOT.

a. The City's engineer and/or inspector shall work with and through UDOT's Project Representative and shall give no orders directly to UDOT's Design-Builder unless authorized in writing to do so. UDOT will accomplish the Utility Work covered herein on City's facilities in accordance with the plans and specifications provided and/or approved by the City, including changes or additions to the plans and specifications, which are approved by the Parties hereto.
b. The City shall immediately notify UDOT's Project Representative and the Design-Builder Project Representative of any deficiencies in the Utility Work on the City's facilities. The City shall follow up with written detail to UDOT's Project Representative and the Design-Builder Project Representative of its findings within 24-hours of making its initial notification.
c. UDOT will respond to City's concerns within 24-hours of written notification.
d. The City, through its inspection of the Utility Work, will provide UDOT's Project Representative with information covering any problems or concerns the City may have with acceptance of the facilities upon completion of the Utility Work.
e. Any periodic plan and specification review or construction inspection performed by UDOT arising out of the performance of the Utility Work does not relieve the City of its duty in the performance of the Utility Work or to ensure compliance with acceptable standards.

DRAFT

14. DAILY RECORDKEEPING

UDOT's Resident Engineer will keep daily records of the inspection performed by the City. Daily inspection records will be in duplicate on a form to be prepared by the City or UDOT. The type of form to be used shall be preapproved by UDOT's Contracts, Compliance and Certification Manager. The inspection records shall be signed by UDOT's Field Representative, and the City or its authorized representatives. Copies of the inspection records shall be retained by the parties to this Agreement.

15. REIMBURSEMENT

UDOT will not reimburse the City for costs incurred by City personnel for design review, observation, inspection, and operation of valves performed as part of their regularly assigned duties. Should it become necessary for the City to procure outside services to perform design review, observation, or inspection to accommodate UDOT's Utility Work and Project schedule, the City shall notify UDOT. Upon concurrence by UDOT, a supplemental agreement for the cost of the services will be executed at which time the City may procure outside services through appropriate solicitation.

16. SUBMITTAL OF ITEMIZED BILLS

The City shall submit itemized bills covering the actual costs incurred for outside services to perform design review, oversight, and inspection work covered by supplemental agreements to UDOT's Contracts and Compliance Specialist:

UDOT Contracts and Compliance Specialist
4501 South 2700 West
Construction Office, Box 148220
Salt Lake City, Utah 84114-8220

Itemized bills shall bear the Project and supplemental agreement numbers, supporting sheets, and a complete billing statement of all actual costs incurred, following the order of the items in the detailed estimates contained in the supplemental agreement and be submitted to UDOT within 60 days following completion of outside services by the City on the Project. Otherwise, previous payments to the City may be considered final, except as agreed to between the Parties in advance.

UDOT will reimburse the City within 60 days after receipt of the billings, but only for items complying fully with the provisions of Utah Administrative Code R930-8. Failure on the part of the City to submit final billings within 6 months of the completion of outside services will result in UDOT's disallowance of that portion of outside services performed by the City.

17. SALVAGED MATERIALS

All materials from City's existing facilities which are recovered by UDOT while performing the Utility Work and not reused on this Project shall become the property of the Design-Builder unless otherwise agreed to in advance by the Parties hereto.

18. RIGHT TO AUDIT

DRAFT

UDOT and the Federal Highway Administration shall have the right to audit all cost records and accounts of the City pertaining to this Project in accordance with the auditing procedure of the Federal Highway Administration and 23 C.F.R. § 645, subpart A. Should this audit disclose that the City has been underpaid, the City will be reimbursed by UDOT within 60 days upon submission of additional billing to cover the underpayment. Should this audit disclose that the City has been overpaid, the City will reimburse UDOT within 60 days of notification of audit findings in the amount of the overpayment. For purpose of audit the City is required to keep and maintain its records of outsides services covered herein for a minimum of 3 years after final payment is received by the City from UDOT.

19. **ACCEPTANCE AND MAINTENANCE**

Upon completion of the Utility Work of City facilities by UDOT, the City will accept, own, and maintain its own facilities. The City shall be the sole owner of the facilities upon completion of the Project unless otherwise agreed to by the Parties. To the extent it may lawfully do so, City further agrees to relieve UDOT from any responsibility or liability that may result from its new facilities or the operation thereof.

20. **ACCESS**

It is understood that access for maintenance and servicing of City's facilities located on the right-of-way of the Project will be allowed only by permit issued by UDOT to the City, and that the City will obtain the permit and abide by conditions thereof for policing and other controls in conformance with Utah Administrative Code R930-7.

21. **INDEMNIFICATION**

UDOT and the City are both governmental entities subject to the Governmental Immunity Act. Each Party agrees to indemnify, defend, and save harmless the other from and against all claims, suits and costs, including attorneys' fees for injury or damage of any kind, arising out of its negligent acts, errors or omissions of its officers, agents, contractors or employees in the performance of this Agreement, and from and against all claims, suits, and costs, including attorneys' fees for injury or damage of any kind. Nothing in this paragraph is intended to create additional rights to third parties or to waive any of the provisions of the Governmental Immunity Act. The obligation to indemnify is limited to the dollar amounts set forth in the Governmental Immunity Act, provided the Act applies to the action or omission giving rise to the protections in this paragraph. The indemnification in this paragraph shall survive the expiration or termination of this Agreement.

22. **MISCELLANEOUS**

a. Each Party agrees to undertake and perform all further acts that are reasonably necessary to carry out the intent and purpose of this Agreement at the request of the other Party.

b. This Agreement in no way creates any type of agency relationship, joint venture, or partnership between UDOT and City.

DRAFT

c. The failure of either Party to insist upon strict compliance of any of the terms and conditions, or failure or delay by either Party to exercise any rights or remedies provided in this Agreement, or by law, will not release either Party from any obligations arising under this Agreement.

d. This Agreement shall be deemed to be made under and shall be governed by the laws of the State of Utah in all respects. Each person signing this Agreement warrants that the person has full legal capacity, power and authority to execute this Agreement for and on behalf of the respective Party and to bind such Party. This Agreement may be executed in one or more counterparts, each of which shall be an original, with the same effect as if the signatures were made upon the same instrument. This Agreement may be delivered by facsimile or electronic mail.

EXHIBIT A

Department of Public Works

STANDARD OPERATIONAL GUIDELINE

Subject: **Water System, Disruption of Service Approval Process**		SOG No.: **WS002**
Origin Date: May 1, 2010	Revison Date: April 4, 2011	Page(s): 5

1. INTRODUCTION

A. Purpose: To allow for the planning, proper coordination, notifications and approvals required for a safe and timely disruption of water service to City water customers in cases of planned construction, due to either City capital improvement projects or private development projects. Planning for such disruptions must begin during the design phase of the project, and continue through construction and project acceptance phases of the work.

B. Scope: Affects Engineering, Construction Inspections, Water, and Streets divisions of the Public Works Department. Also affect City Capital Improvement Projects and private development projects.

C. Definitions:

D. Precautions/Safety: Trench safety and planning for safe evacuation of staff from areas where pipelines may be under construction.

E. Responsibility: The City's Project Engineer has primary responsibility for this work. Others such as the City's Water Division also have key roles in the work, and the City's or Developer's Contractor has a key role to play in the safe and timely completion of the work.

F. Equipment:

G. Notifications: The Director of Public Works is to be notified at least 24-hours in advance of the actual shut-down by email.

2. PROCEDURE

Water disruptions or outages which are a result of planned construction projects are required to be coordinated from the inception of the project through construction. This means that all of the Department divisions indicated above, will need to be continually coordinated with during all phases of the project. The paragraphs below indicate the various phases of the project, which divisions and positions are involved, and how these activities are to be carried out. Extreme carefulness must be observed in planning and carrying out these activities as

they can significantly affect City water customers and others.

A. Design Proces: As part of the design process, the City's Project Engineer and Consultant are to keep all affected parties involved and informed. This is critical to the success, safe, and timely completion of the construction and water service disruption/outage.

1) Adequate System Information: This process assumes reasonable amounts of adequate water system information is available. Existing drawings must be researched, and potholing will be required to fully answer any questions the Project Engineer and Consultant may have. Reasonable amounts of funds spent on potholing are worth the money and this area of project investiation should not be short-changed. It is understood that full information is not possible in many instances, but efforts need to be made to have as much information available if reasonably possible.
2) Existing As-built Drawings: Use existing as-bulit drawings to begin with and improve on them through additional coordination with Field Staff and through potholing. The GIS/Technical Support Division of the Department is responsible for managing the as-builts drawings with assistance for all of the other divisions in the Department.
3) Roadway Intersection Drawings: Use the existing Roadway Intersection Drawings which show all valves, water lines, other utilities, improve these as needed, and then include them in the Released for Construction Drawings. Ensure the drawings are as correct as possible before bidding. If the Project Engineer does not feel comfortable with the accuracy of these drawings, they should be noted as 'schemtic drawings' with indications that locations, sizes, etc. are for general information only and are not to be relied on.
4) Planning/research of Needs and Impacts (Preliminary): All Engineering, Inspection, O&M, and Consultant staff is to participate in this planning work for water outages. The following need to be included:
    - Identify options for providing water service.
    - Field Research of Water System: Water Division is to Identify existing valves, mark, and exercises them to make sure they operate properly.
    - Impacted Customers – Staff is to identify the water customers of the City who will be impacted by any disruption or outage of the Water System.
    - Night outage(s) – If night outages are required, coordinate with the SLVHD for work to be done between the hours of 10 p.m. and 7 a.m. O&M staff will also need to be coordinated with for actual water valve closures and only O&M staff is to open/close these valves.
5) Identification of Possible Water Outages: Project Engineer/Consultant identifies possible/required shut-downs as part of the design process. These are to be noted in the project Contract Documents and conditions indicated for water outages.
6) Engineering Inspector Review of Contract Documents: The Engineering Inspector is to review the 'Released for Construction Drawings', and coordinate with the Project Engineer and remainder of the Project Team on how to address outage(s).
    - Determine proposal for how the work might be done. Suggest or require process to contactor as part of Contract Documents.

7) Constructability Review Meeting: As part of the design process, a meeting or set of meetings as needed, with the design staff, project engineer, O&M staff, and inspection staff to identify potential outages. The Engineer, O&M staff, and Inspector are to then begin working through how to plan for these outages and the impacts of those outages.
7) PW O&M Review of Drawings – Engineering staff are to make sure O&M staff has reviewed the preliminary documents (30-50% review) and their comments have been incorporated into the final documents (80-90%), prior to putting the Documents out for bid.

B. Preconstruction/Construction Meeting Coordination: As part of the process, a mandatory preconstruction/construction meeting is to be held where water distruptions/outages are discussed. City staff is to express their concerns and present the information they have prepared and require the Contractor to develop a written water disruption/outage plan.

1) Scheduling: Schedule the meeting through Outlook at least 2 weeks in advance of the meeting.

2) Persons to Attend: The Project Engineer, Consultant, Engineering Inspector, Water Division staff and Contractor must be invited and must attend. If the Contractor's Superintendent does not show up at the meeting, the meeting is to be cancelled and rescheduled.
3) Communications: Establish City and Contractor chain of command and which persons are the point-to-point contacts on the City's, and the Contractor's sides of the work.
4) Agenda Item: Water service disruptions/outages are to be identified and discussed as part of meeting agenda. The Engineering Inspection Supervisor is responsible for this meeting and this item.
5) Contractor's Proposal and Schedule: The Contractor is to take all of the available information available and propose methods/processes/timelines for distruption/outages. Contractor is to prepare and submit a Contract Schedule for the work to the Project Inspector.
6) Approval Process: Once the Contractor has submitted a proposed plan and schedule for the disruption/outage, City staff is to meet and go over the Plan to make sure it meets all of their requirements. Corrections need to be submitted back to the Contractor in writing and a new Plan prepared. The Plan is not approved until the Water Division, Engineering Inspection, Engineering, and Contractor, signs off on the Plan.

C. Request for Water Disruption/Outage: The Contractor is to make a written request for any water disruption or outage he feels is necessary, as part of the project. The following applies to this process:

1) Request is made by the Contractor to Engineering Inspector and must include:
   - Request indicates answers to the questions of 'what, when, where, why'.
   - The request must be made in writing. A letter or email will suffice as long as it contains the correct information.

- The Water Division requires a minimum of 72-hours notice to begin customer notification of outage and implementation of the City's portion of the Plan in the Field.

2) Engineering Inspector begins coordination with Water Division through the Water Superintendent. The Water Superintendent will coordinate with his staff including the Water Operations Supervisor.
3) Notification of Utilities Manager and Public Works Director: Both the Utilities Operations Manager and the Public Works Director are to be kept up-to-date on planning and approval processes and especially as the project moves closer to the actual water service disruption/outage.

D. Planning/Research of Needs and Impacts: The purpose of this section is to take the Plan submitted by the Contractor and make sure that it will actually work. City staff is the most familiar with the Water System, and will have the final approval on whether the Plan is approved. The following steps need to be considered in doing this phase of the work.

1) Engineering inspector schedules meeting with Water Division staff/Contractor to coordinate outage.
2) Staff brings all information developed as part of the desgin process and proposals from the Contractor.
3) Project Team develops reviews the proposed plan and develops an actual written water outage plan and prepares a scope of work, or step by step plan, of what is going to be done. This will include detail such as which pipe will be cut first, which one second, which valves will we closed, how muc h time will it take, etc. Make sure everyone involved in the outage: contractor, contractor's on-site superintendent, workers, City project engineer, city inspector, and O&M staff all have copies and understand the order of the work. Deviations must be coordinated with everyone (Refer to KHP, Mid-Jordan Light Rail, Redwood PNR Waterline Tie-in plan. Includes "Overview", "Safety", "Quality", "Compliance", "Survey", and "Discussion Items").
4) Plan for Contingencies – Look at all drawings, identify the scope of work (work to be done), and identify contingency plans if things should go wrong. For instance, if we cut this pipe, do we understand how to close off all flow to the pipe and have we tried it out before hand.
5) Additional Potholing – If the Contractor feels that additional potholing is required, work out a solution for doing so and pay him, if additional compensation is warranted.
6) Obtain all Permits: Make sure all appropriate permits have been obtained as part of the planning process. This may include:
   - SLVHD Permit - for night work
   - UDOT Permit
   - City of West Jordan Encroachment Permit
   - Others as needed

E. Pre-activity Meeting/Actual Water Disruption/Outage: Just prior to the actual beginning of the outage, and work preliminary to the outage, a pre-activity meeting is to be held to discuss in detail the work to be done as part of the water disruption/outage. The following need to be discussed:

EXHIBIT A

1) Communications - Reaffirm City and Contractor's organizations, who are in charge, and who are the point-to-point contacts on the Contractor's side and who on the City's side. Make sure everyone has the correct phone numbers.
2) Implement final water outage plan – Needs to include priority of construction: which lines to cut first, second, etc. Plan needs to include a flushing plan and safety plan.
3) Contingency Plan(s) - Implement plan(s) for contingencies as required.
4) Schedule – execute work within appropriate time windows.
5) Permits: Make sure all the permits have been obtained.
6) Approval form: *(Do you want an approval form where everyone signs off on the outage, basically a permit?) (1st comment – No – cover page of plan/excavation permit is the form.)*
7) Inspections and Testing: Inspections and sampling are to be accomplished per City and AWWA standards.
8) Documentation of Work: The Engineering Inspector is responsible for taking pictures of the work with excavation open, take measurements and survey of critical points to document what is in the intersection, or other location, for future reference.
9) Questions regarding Unknown Pipelines/Conduits/Strucctures: If there are questions about what pipelines, conduits do, identify them prior to closing the excavation.
10) As-built Drawings: The Contractor is responsible for ensuring as-built drawings are prepared and meet the Engineering Inspector's requirements, and are turned over to the Inspector as the end of the project. The Engineering Inspector is responsible for collecting all as-built information from the Contractor and transferring them to the Project Engineer. The Project Engineer will work with the GIS Division is making the changes to the City's as-built drawings to keep them up-to-date.

F. Post-activity Meeting: Once the work is complete, all City and Contractor are to meet to go over the actual outage. Go over what went right and wrong and improve the process.
   1) Process for as-builty drawings – City Engineer/Supervising Inspector need to look at the requirements for as-builting drawings and make sure they are complied with.

Applicant Name:	**Cost of Permit:**
Title:	**Check No.:**
Address:	**Receipt No.:**
City, State, Zip:	**Work No.:**
Contractor Performing Work:	**Cell No.:**
Nature of Work: Telephone ● Electrical ● CATV ● Gas ● Water ● Stormdrain ● Wastewater ● Secondary Water ● Other:	**Email:**

FAILURE OF THE PERMITTEE TO FOLLOW THE PROVISIONS OF THIS PERMIT SHALL RESULT IN THE RETRACTION OF THE PERMIT BY THE CITY AND LOSS OF PRIVILEGESTO WORK WITHIN THE CITY'S RIGHT-OF-WAY.

1. Standards/Location of Work
The above indicated applicant is hereby granted subject to Title 8, Chapter 8 of the City's Municipal Code, the City's Policies and Design Criteria Manuals, the Construction Specifications Manual, Standard Drawings Manual, State Occupational Safety and Health Laws, Manual on Uniform Traffic Control Devices (MUTCD), Instructions to Flaggers, the approved plans, and any special limitations set herein, permission for the purpose of:

_____within the right of way limits in the

following locations _____

2. Prior to Work
Prior to Work being performed in the public right-of-way, the Permittee will make proper provisions for protecting the public's safety and property. This permit is a binding agreement between the Permittee and the City and shall be only for the location listed on this permit.

3. Permit Fee
The City of West Jordan Encroachment Permit Fee shall apply, for an excavation in public right-of-way, as listed on the Current Uniform Schedule of Fees and Services Charges:

_____ feet long, _____ feet wide, and _____feet deep.

4. Beginning and Ending of Work
The work permitted herewith shall commence on _____ and shall be diligently prosecuted to completion. The work shall be completed and all disturbed surface or objects restored on or before _____. In the event work is commenced under this permit and the permittee fails or refuses to complete the work, the City of West Jordan may, at its election, fill in or otherwise correct any existing deficiencies at the expense of the permittee and subject to immediate payment by the permittee.

5. Performance Bond and Insurance
The Permittee shall supply to the City a Performance Bond for a period of three (3) years after completion of the work to guarantee satisfactory performance. Amount of the bond shall be determined by the encroachment department upon review of this application. The bond shall be in the name of the Permittee.

Insurance
The Permittee shall provide to the City copies of workers compensation insurance and liability insurance that names the City its elected officials, appointed officials, employees, volunteers, and agents as additionally insured (This verbiage must be a part of your Lability Insurance under Special Items.. The Permittee shall be responsible for any liability or personal injury involved through neglect. The Permit Holder agrees to indemnify the City, its elected officials, appointed officials, employees, volunteers, and agents against all claims, demands, costs, damages, attorney fees or other expenses of any kind by such neglect

DRAFT

EXHIBIT B

6. Notice of Work to Begin
Before work permitted herewith is commenced, the permittee shall call in on the inspection line (801) 569-5051 before 3:00 p.m. Commencement of said work is understood to indicate that the permittee will comply with all instruction and regulations of the City of West Jordan (as listed) with respect to performance of said work and that she/he will properly control and warn the public of said work to prevent accident. The Permittee shall inform all emergency services, school districts, UDOT and UTA two (2) working days in advance of any approved road closures or detours.

7. Restoration of Right-of-Way
This permit is issued with the understanding that the Permittee will restore the right-of-way to its original or better condition. Such restoration shall take place within two (2) working days from the time of completion of the Work. If the Permittee fails to meet this obligation within the time indicated herein, the City may make all the necessary restorations at the Permittee's expense.

8. Limits of Work Area
Permittee shall not perform any work on City of West Jordan right-of-way beyond those areas of operation stipulated on this permit. This permit in no way allows the Permittee access to private properties; the individual property owners must grant access.

9. Suspension of Work
If permittee fails to comply with City of West Jordan regulations, specifications or instructions pertinent to this permit, the City Engineer or his duly authorized representative, may by verbal order, suspend the work until the violation is corrected. If permittee fails or refuses to comply promptly, the City Engineer or his authorized representative may issue a written order stopping all or any part of the work. When satisfactory corrective action is taken, an order permitting resumption of work may be issued.

10. Permit Period/Extensions
This permit is valid forty-five (45) days from issue date. The City may grant an extension of time with a written request from the Permittee to the Engineering Department. Such request must be submitted five (5) working days before the expiration date of the permit.

11. On-Site Permit Requirements
A copy of the City's current trench detail, approved plan of the Work, approved traffic control plan, a signed copy of this Permit, and a copy of the City's Public Improvement Standards, Specifications, and Plans shall be on the work site at all times. The City shall be granted access to these papers at all times.

12. Temporary Asphalt Patching
Asphalt patching to roads between October 15 and March 1 will be considered temporary only and must be replaced after March 1 following APWA standards.

Special Limitations:

- Traffic Control Plans, signs and channelizing devices shall conform to MUTCD Standards as a minimum. Traffic Control Plan to be approved by City's Traffic Engineer.
- Contact the inspection line at (801) 569-5051 48-hours prior to the time of lane or shoulder closure, with route, location and duration. Call again when the job is complete.
- This Agreement and/or permit are for City of West Jordan approval only. You are responsible to obtain clearances from UDOT, UTA, railroads, private property owners and other local jurisdictions that you are working with.
- Call for Blue Stakes and check for other utilities in the area prior to excavation.
- Saw cut and tack coat joints. Replace asphalt to the existing depth plus 1-inch, with a minimum of 4-inches, or as directed by City Engineer.
- Untreated Base Course with 97-percent compaction for the full depth of the trench with 6-inch lifts.
- Licensee is responsible for repairing and/or restoring any portion of the roadway damaged during construction.
- Licensee must restore shoulder of highway to its original or better condition to include reseeding, replacing sidewalk, fencing, pipe, culverts or signs removed or damaged during construction.
- Striping is to be replaced with the same material within 48-hours of completion of the permit. The materials must maintain City of West Jordan standard specifications for 6-months.
- No storage of backfill material or pipe will be allowed within the ASHTO Clear Zone. Excavations to be backfilled daily if possible.
- If excavation is within 350-feet of an intersection, permittee is required to contact the City Traffic Engineer for requirements.
- Permittee will comply with all applicable environmental laws.

DRAFT

EXHIBIT B

- All borings shall show an approved cross section showing all other existing utilities, and clearances from such.
- Steel drum vehicles or steel tracked vehicles or equipment shall use minimum ¾ inch plywood over railroad concrete pavement to protect the concrete while crossing the railroad track area.
- For concrete paved roadways, the permittee is responsible for all panels that have 2-inch holes bored into the panel. If these panels fail in the future due to the bores, the Permittee will be required to replace the affected panels.

Accepted By:
My carrying out the activities allowed by this permit is conclusive evidence that I have accepted all provisions, limitations, and restrictions of the permit and attachments, understand and agree to all penalties for failing to comply with them and understand my ability to review a sample permit and applicable attachments at the City Engineer's office.

BUILDING DEMOLITION(S)

A Building Permit and fee are required for each building demolition. The fee for a building demolition permit is $126.25 per building.

Follow these steps to expedite your demolition permit:

1. Fill out a building permit application, with the address, type of structure to be demolished, and contractor(s) information.
2. Submit approval letter from the State Division of Air Quality 801-536-4053. Jobs having Asbestos requires an inspection by a Utah Certified Asbestos Inspector prior to disturbing suspected asbestos. 801-536-4451.
3. Submit approval letter from the Salt Lake Valley Health Department. Ph. 801-313-6626, 788 E Woodoak Lane, Murray.
4. Notify and request disconnection from the following utilities and **provide a signature from the West Jordan Engineering department for water and sewer disconnection.**
5. If contractor/company disturbs or removes painted or coated surfaces greater than 6 sq ft in a room on the interior or 20 sq ft on the exterior of target housing or child-occupied facilities built before 1978, the company may be subject to the ***new lead based paint and/or renovation, repair and painting rule.*** 801-536-4018

CITY OF WEST JORDAN BETTERMENTS

The City has requested the following Betterment Work be included with the Project Work:

7000 Betterment Work

City has provided concept layouts for proposed Betterment Work as shown and described below. Final Betterment Work plans will be memorialized through a separate supplemental agreement between UDOT and the City.

1. Upgrade existing 12-inch sewer to 24-inch sewer from sta. 1+00 to sta. 5+25 +/-.
2. Install new 24-inch secondary water pipeline casing from sta. 1+00 to sta. 6+05 +/.

9000 South Betterments

City has requested Betterment Work as listed below. Final Betterment Work plans will be memorialized through a separate supplemental agreement between UDOT and the City. City shall be responsible for permitting costs associated with Betterment Work.

1. Upgrade existing 12-inch sewer to 24-inch from Winthrope Circle to approximately 3450 West.

2. Water upgrades:
   a. Replace existing 10-inch waterline with new 12-inch DIP waterline or equivalent from Winthrope Circle to hospital connection.
   b. Replace 12-inch waterline with new 12-inch DIP waterline or equivalent from old PRV location to hospital connection.
   c. Place new 16-inch waterline in same approximate alignment as the existing 16-inch water to replace Zone 1 pipe and connect to Zone 2 transmission with 16 inch pipe. Length of pipe installation shall be based on pressure class.

3. PRV upgrades:
   a. Combine two existing PRV's vaults in 9000 South into one vault. It is anticipated that the exiting PRV vault located in 9000 South, within the south park-strip, will be a Project Work conflict resulting in Utility Work at UDOT's cost. City requests the existing PRV within 9000 South, within roadway, be placed into the PRV vault being relocated as Project Utility Work. The Utility Work to abandon the 9000 South PRV, within roadway, and to combine the two PRV vaults is pro-rated Betterment Work. Costs of the Betterment shall include, design, right-of-way, materials, and construction exceeding the Project Work conflict requirements.

DRAFT

CITY OF WEST JORDAN AESTHETIC AND LANDSCAPE BETTERMENTS

The City has requested the following Betterment Work be included with the Project Work:

UDOT will include the following Aesthetics and Landscaping Betterment Work items into the Project Work. UDOT will supplement up to $100,000.00 towards each City intersection at 7000 and 9000 South for Aesthetics and Landscaping Betterment Work. UDOT and the City shall enter into supplemental agreements to cover Aesthetics and Landscaping Betterment Work described below. City will be responsible for paying the actual costs greater than $100,000.00 associated with the Aesthetics and Landscaping Betterment Work items, based on UDOT's actual quantities placed.

Description of Aesthetics and Landscaping Betterment Work:

Element	Desired City Betterment
Parapets:	1. Add the City of West Jordan logo to one or two visible locations on each bridge at 7000 and 9000 South.
Lighting and Traffic Signal Poles:	1. Matching all City affected streetlights to new LED standards, both arterial and local streetlights. Lights must match Section 16500 and current manufacturer specifications. 2. Traffic Signal Poles shall be black powder coated as minimum standard.
Landscaping Remnant Parcels:	1. Sod, trees, plants, and sprinkler systems installed according to City Parks' standards, which will be maintained by the City.

CITY OF WEST JORDAN
SUPPLEMENTAL AGREEMENT NO. ___

Supplement to UDOT Finance No. _____

THIS SUPPLEMENTAL AGREEMENT, made and entered into this _____ day of _____, 20____, **Utah Department of Transportation**, ("UDOT"), and **City of West Jordan** a Municipal Corporation of the State of Utah, ("City") each as ("Party") and jointly as ("Parties").

The parties hereto entered in to a Master Utility Agreement (MUA) dated _____, UDOT Finance No. _____. All the terms of the Master Utility Agreement remain in full force and effect unless otherwise specified herein.

The Parties agree as follows:

1. UDOT will perform the following described Utility Work in accordance with the terms and conditions of the MUA:

   a. Description of Utility Work to be performed, including proposed location, described in Exhibit "A" that is incorporated by reference: (Plan Sheets Attached)

   b. The City requirements as shown in the MUA – City Requirements, are modified as follows:
      i.

   c. Anticipated duration of Utility Work:

   d. Total estimated cost of City's (100% reimbursable) outside services: (Detailed Estimate Attached)

2. UDOT will notify the City's Project Representative, David Murphy, telephone number (801 569-5074, email davidm@wjordan.com at least 48 hours in advance of beginning the Utility Work covered herein, or in accordance with the specific terms of the MUA, as applicable.

ZAYO GROUP, LLC
MASTER UTILITY AGREEMENT

THIS MASTER UTILITY AGREEMENT, made and entered into this 30th day of August, 20 16, by and between the **Utah Department of Transportation**, ("UDOT") and **Zayo Group, LLC**, a Company of the State of Colorado, ("Company") (each as "Party" and jointly as "Parties").

RECITALS

WHEREAS, UDOT is preparing to request proposals for and award a design-build contract for the highway project identified as Project Number S-0154(12)11, 4 Interchanges on Bangerter Highway in Salt Lake County, Utah, ("Project"); and

WHEREAS, UDOT's design-build contractor ("Design-Builder") will complete the design and administer construction of the Project; and

WHEREAS, UDOT has identified Company facilities within the limits of the Project which may necessitate the relocation, protection, or adjustment of the facilities, ("Utility Work"); and

WHEREAS, the Company desires for the Design-Builder to design and construct the Company's Utility Work except cable/pedestal procurement, pulling, and splicing necessitated by the Project; and

WHEREAS, the Company will perform the necessary review and approval for the design and construction of its Utility Work, provide cable/pedestal procurement, pulling, splicing, and construction inspection to accommodate the Project; and

WHEREAS, for the purpose of expediting any required Utility Work and reimbursement the Parties are entering into this Project Master Utility Agreement with the understanding that future supplemental agreements to this Agreement will be entered into covering Utility Work to be accomplished by the Company and UDOT at specific Project locations.

THIS AGREEMENT is made to set out the terms and conditions where under the Utility Work shall be performed.

AGREEMENT

NOW THEREFORE, the Parties agree as follows:

1. CONTACT INFORMATION

UDOT's Project Representative is Alana Spendlove, UDOT Project Utility and Railroad Leader, telephone number (801) 887-3462, and e-mail aspendlove@utah.gov.

UDOT's Resident Engineer for 5400 South and 7000 South interchanges is Bryan Chamberlain, telephone number (801) 887-3405, and e-mail bchamberlain@utah.gov, or their designated representative, as assigned.

UDOT's Resident Engineer for 9000 South and 11400 South interchanges is Ken Talbot, telephone number (801) 360-8750, and e-mail kentalbot@utah.gov, or their designated representative, as assigned.

UDOT's Field Representative contact person will be identified in subsequent supplemental agreements.

Company's contact person is Michael Sullivan, telephone number (602) 354-9486 and e-mail michael.sullivan@zayo.com.

After awarding the Project, UDOT will provide the Company with the Design-Builder contact information, hereinafter referred to as "Design-Builder Project Representative".

2. AUTHORIZATION FOR DESIGN WORK

In order to facilitate coordination and obtain technical information about the Company's facilities and requirements for inclusion in this Agreement and the request for proposals, UDOT gave the Company authorization for preliminary design engineering on April 26, 2016.

3. SUBSURFACE UTILITY ENGINEERING

UDOT has performed Subsurface Utility Engineering (SUE) within the limits of the Project. Additional SUE work to determine the precise location of underground facilities at specific, critical locations on the Project will be reviewed with the Company

4. PROJECT COORDINATION

Company and UDOT agree to have the Design-Builder include in the Project, items of Utility Work for the Company's facilities.

During the development of the Project design, the Company and UDOT, along with its Design-Builder, shall consult as necessary in an effort to determine if conflicts with the Company's facilities can be avoided. If Utility Work is required, UDOT will be responsible to propose and provide a location for the facilities. UDOT will provide the Company with Project design plans as early as possible, and will schedule and meet with the Company to review the design, construction, estimates of cost, and scheduling for the Company's Utility Work at specific locations

on the Project to ensure maximum lead time for advance order of materials and work force scheduling.

The Company shall advise UDOT's Project Representative of the approximate time required for completion of the Utility Work and shall diligently pursue its Utility Work so that completion can be accomplished according to the pre-determined time schedule negotiated by the Company and UDOT in the supplemental agreement issued hereto for a specific Project location. The Company shall immediately notify UDOT's Project Representative by phone call or email, of its discovery of any occurrence or unforeseen circumstances that would prevent the Company from completing its Utility Work according to the time schedule provided. In addition, the Company shall describe the circumstances in writing within 24-hours of the discovery to UDOT's Project Representative.

5. COMPANY REQUIREMENTS

UDOT will comply with the following Company Utility Work requirements:

1. Company splicing hours are from 12:00 p.m. to 5:00 a.m.
2. Provide minimum 12 inch separation of conduit from power in joint trench.
3. Include #14 gauge tracer wires in all conduits.
4. The Company will require a 2 week review and approval period for proposed designs, estimate review, and internal approvals after design plans and estimates are delivered to the Company.

6. UDOT TO DESIGN AND CONSTRUCT A PORTION OF UTILITY WORK

UDOT shall perform the necessary design work, cost estimating, field and office engineering, furnish all materials except cables and pedestals, and perform the Utility Work except pulling and splicing, necessitated by the Project.

UDOT will design the Utility Work in accordance with Company's standards regularly followed by the Company in its own work and not considered a betterment. In the event of a conflict between UDOT and Company standards, the higher standard will be applied.

UDOT will secure permits required for Utility Work for Company's facilities.

UDOT will supply as-constructed plans for the Utility Work it performs, in _____ format, upon completion of any required Utility Work.

7. COMPANY TO PERORM INSPECTION AND CONSTRUCT A PORTION OF THE UTILITY WORK

The Company will perform inspection of the Utility Work for the Company's facilities that will be performed by UDOT. UDOT will accomplish the Utility Work on the Company's facilities in accordance with the plans and specifications approved by the Company. Changes or additions to the plans and specifications shall be approved by the Company and UDOT through a supplemental agreement.

The Company will provide all cables, pedestals, pulling, and splicing necessary to accommodate the Utility Work of its facilities on the Project. The Company requires 2 weeks' notice to schedule splicing and fiber pulls and will determine the splicing window based on the circuit.

8. STANDARD SPECIFICATIONS AND REGULATIONS

The Company, while engaged in the preliminary design and Utility Work of its facilities, shall comply with UDOT's 2012 Standard Specifications for Road and Bridge Construction and Utah Administrative Code R930-7.

9. UNDERBUILT AND FACILITY REMOVAL REQUIREMENTS

The Company is responsible to see to the removal of all Company-owned underbuilt facilities from utility poles that will be relocated or removed due to the Project.

10. RIGHT-OF-WAY

Any easements or replacement right-of-way required in conjunction with the Utility Work of Company's facilities will be acquired by UDOT in accordance with the requirements of Utah Administrative Code R930-8-7.

11. MAINTENANCE OF TRAFFIC (MOT), TRAFFIC CONTROL, CLEAR/GRUB, AND SURVEYING

UDOT will provide MOT and traffic control for Utility Work at no cost to the Company. The Company is responsible to coordinate Utility Work schedules and traffic control needs with UDOT to facilitate the Project schedule and minimize impacts to the public. Except in the case of emergencies, Company's Utility Work on the Project will be scheduled in compliance with the requirements of the Limitation of Operations contained in UDOT's Design-Builder contract with respect to lane closures, peak hour Utility Work restrictions, holiday and special event limitations, etc.

UDOT will provide, at no cost to the Company, clearing and grubbing for the Utility Work as required by the Company and in accordance with UDOT's Standard Specifications.

Surveying and staking of roadway facilities as required by the Company will be provided by UDOT in accordance with UDOT's Standard Specifications. The cost of the surveying and staking will be at UDOT's expense and the Company will have no obligation for the cost of surveying. Any of UDOT's survey control stakes or bench markers, which are removed or damaged by the Company, shall be reestablished by UDOT at Company's expense.

12. BETTERMENT WORK

If the Company desires to include betterment work in the Project at any specific location, UDOT may agree to the betterment work providing the difference in costs between the functionally equivalent required Utility Work and the Company's desired betterment work, that is not required by the Project, shall be at the sole cost of the Company and the betterment work can reasonably

be accommodated without delaying UDOT's Project. The betterment work will be addressed by a separate supplemental agreement between UDOT and the Company.

Once a Design-Builder has been selected by UDOT, any betterment work request will be negotiated directly with the Design-Builder. However, it is at UDOT's sole discretion to approve the betterment work.

13. SUPPLEMENTAL AGREEMENTS

UDOT and the Company shall enter into individual supplemental agreements to cover Utility Work at specific Project locations. Each supplemental agreement will include a description and location of the Utility Work to be performed, design drawings showing the original and proposed locations of the Company's facilities, Utility Work schedules, cost estimates from all Parties, participation shares for UDOT and the Company, any proposed betterment work, and any necessary right-of-way documents. The estimates do not account for increases due to unknown and unforeseen hardships in accomplishing the Utility Work. A copy of the format of the proposed supplemental agreement is marked Exhibit "A" that is incorporated by reference.

The Company will require a 2 week review and approval period for any final supplemental agreement submitted to the Company by UDOT.

In the event there are changes in the scope of the Utility Work, extra Utility Work, or changes in the planned Utility Work covered by a supplemental agreement, a modification to the supplemental agreement approved in writing by the Parties is required prior to the start of Utility Work on the changes or additions.

14. UDOT AUTHORIZATION TO PROCEED WITH UTILITY WORK

The Company shall not perform any Utility Work until the supplemental agreement for the Utility Work is signed by the Company and received by UDOT. UDOT will review and approve the supplemental agreement and will issue an authorization to proceed to the Company for each specific Utility Work location.

15. UDOT TO NOTIFY THE COMPANY BEFORE BEGINNING UTILITY WORK

UDOT will notify the Company at least 2 business days in advance of beginning any Utility Work covered by any supplemental agreements hereto, to allow the Company time to schedule an inspector to be present during the Utility Work. Subsequent notification of when and where Utility Work will be performed will be given on a day-to-day basis. Should UDOT fail to give advance notification and Utility Work is performed without the presence of a Company inspector, UDOT will, at no cost to the Company, facilitate inspection of the Utility Work including, if necessary, uncovering the Utility Work.

16. COMPANY TO NOTIFY UDOT AND THE DESIGN-BUILDER BEFORE BEGINNING UTILITY WORK

The Company will notify UDOT's Project Representative as well as the Design-Builder Project Representative at least 2 business days in advance of beginning any Utility Work covered by any supplemental agreements hereto. The Company will give subsequent notifications of when

and where the Company will be performing Utility Work to UDOT's Field Representative and the Design-Builder Project Representative on a day-to-day basis. Such subsequent notifications can be informal. Failure on the part of the Company to give proper notification to UDOT's Field Representative and the Design-Builder Project Representative will be cited to the Company and that portion of the Company's Utility Work performed while not under the surveillance of the UDOT Field Representative may be deducted from the reimbursement at UDOT's discretion for.

17. INSPECTION

The Company shall provide on-call engineering support by the Company's engineer or appropriate representative for design review, schedule coordination, or to correct or clarify issues during the Utility Work, and to perform the necessary inspection for the Company's Utility Work installed by UDOT.

a. The Company engineer and/or inspector shall work with and through UDOT's Project Representative and shall give no orders directly to UDOT's Design-Builder unless authorized in writing to do so. UDOT will accomplish the Utility Work covered herein on Company's facilities in accordance with the plans and specifications provided and/or approved by the Company, including changes or additions to the plans and specifications, which are approved by the Parties hereto.
b. The Company shall immediately notify UDOT's Project Representative and the Design-Builder Project Representative of any deficiencies in the Utility Work on the Company's facilities. The Company shall follow up with written detail to UDOT's Project Representative and the Design-Builder Project Representative of its findings within 24-hours of making its initial notification.
c. UDOT will respond to the Company's concerns within 24-hours of written notification.
d. The Company, through its inspection of the Utility Work, will provide UDOT's Project Representative with information covering any problems or concerns the Company may have with acceptance of the facilities upon completion of the Utility Work.
e. Any periodic plan and specification review or construction inspection performed by UDOT arising out of the performance of the Company's Utility Work does not relieve the Company of its duty in the performance of the Utility Work or to ensure compliance with acceptable standards.

18. DAILY RECORDKEEPING

The Company will keep daily records of the inspection and Utility Work performed by the Company forces. Daily records will be in duplicate on a form to be prepared by the Company or UDOT. The type of form to be used shall be preapproved by UDOT's Contracts, Compliance, and Certification Manager. The daily records shall be signed by UDOT's Field Representative and the Company or its authorized representatives.

19. REIMBURSEMENT FOR COMPANY'S UTILITY WORK

In accordance with Utah Code §72-6-116(3)(a)(ii), UDOT will reimburse the Company 50% of the cost of Utility Work of its facilities on state highways and the Company shall pay the remainder of the cost of the Utility Work. UDOT will reimburse the Company 100% of the cost of Utility Work of its facilities located on a public utility easement, on a Company-owned private easement or fee property. The Company shall provide UDOT with a copy of the public utility

easement or subdivision plat, private easement or fee title. The Utility Work and reimbursement for Company's facilities required by the Project will be in conformance with the requirements of Utah Administrative Code R930-8.

The Company shall submit itemized bills covering its actual costs incurred for performing the Utility Work covered by supplemental agreements to UDOT's Contracts and Compliance Specialist:

UDOT Contracts and Compliance Specialist
Utah Department of Transportation
PO Box 141510
SLC UT 84114-1510

Itemized bills shall bear the Project and supplemental agreement numbers, supporting sheets, and a complete billing statement of all actual costs incurred, following the order of the items in the detailed estimates contained in the supplemental agreement, and be submitted to UDOT within 60 days following completion of the Utility Work by the Company on the Project. Otherwise, previous payments to the Company may be considered final, except as agreed to between the Parties in advance. UDOT will reimburse the Company within 60 days after receipt of the billings, but only for those items complying fully with the provisions of Utah Administrative Code R930-8. Failure on the part of the Company to submit final billings within 6 months of the completion of the Utility Work will result in UDOT's disallowance of that portion of Utility Work reimbursement.

If the Company owes a balance to UDOT, the Company will reimburse UDOT within 60 days after receipt of billing from UDOT.

20. SALVAGE CREDIT

In accordance with 23 C.F.R. §645.117 all materials from Company's existing facilities which are recovered by UDOT while performing the Utility Work and not reused on this Project shall become the property of the Design-Builder unless otherwise agreed to in advance by the Parties hereto.

In accordance with 23 C.F.R. §645.117, all materials from the existing facilities, which are recovered in suitable condition for reuse by the Company and not reused on the Project, shall be credited to the cost of the Project at current stock prices. If the materials are not suitable for reuse, they shall be credited at such other prices as agreed upon between the Company and UDOT following inspection of the recovered material.

21. PROJECT DESIGN CHANGES

If UDOT changes the Project design after the Company has completed its design review; or if the Company has completed its portion of the Utility Work of its facilities based on previously approved design plans; the cost of the second design review and/or Utility Work is to be paid in full by UDOT. UDOT will make adjustments for any additional time that may be required for the Company to perform Utility Work on its facilities when required.

22. COMPANY'S COSTS DIFFER BY MORE THAN 10%

If the Company's actual costs incurred for its force account work differs more than 10% plus or minus per line item from the amount contained in the supplemental agreements, the Company is required to submit a letter of explanation with its billings indicating how and why the difference in costs occurred.

23. RIGHT TO AUDIT

UDOT and FHWA shall have the right to audit all cost records and accounts of the Company pertaining to this Project in accordance with the auditing procedure of the Federal Highway Administration and 23 C.F.R. §645, subpart A. Should this audit disclose that the Company has been underpaid, UDOT will reimburse the Company within 60 days upon submission of additional billing to cover the underpayment. Should this audit disclose that the Company has been overpaid, the Company will reimburse UDOT within 60 days of notification of audit findings in the amount of the overpayment. For the purpose of audit the Company is required to keep and maintain its records of Utility Work covered herein for a minimum of 3 years after final payment is received by the Company from UDOT.

The Company shall have the right to review UDOT's cost documentation for the Utility Work performed on behalf of the Company.

24. ACCEPTANCE

UDOT will provide notification to the Company for acceptance of the Utility Work upon completion of the final inspection. Company will have 60 days to respond in writing to UDOT with any additional comments in regards to the Utility Work. In the event that UDOT does not receive a written response within 60 days, UDOT will designate the Utility Work accepted by the Company. Upon acceptance of the Utility Work, the Company will accept, own and maintain its facilities. To the extent it may lawfully do so, Company further agrees to relieve UDOT from any responsibility or liability that may result for its new facilities or the operation thereof.

25. ACCESS & MAINTENANCE

Access for maintenance and servicing of Company's facilities located on the Project right-of-way will be allowed only by permit issued by UDOT. Company will obtain the permit and abide by conditions thereof for policing and other controls in conformance with Utah Administrative Code R930-7.

26. MISCELLANEOUS

a. Each Party agrees to undertake and perform all further acts that are reasonably necessary to carry out the intent and purpose of this Agreement at the request of the other Party.
b. This Agreement in no way creates any type of agency relationship, joint venture, or partnership between UDOT and Company.
c. The failure of either Party to insist upon strict compliance of any of the terms and conditions, or failure or delay by either Party to exercise any rights or remedies

provided in this Agreement, or by law, will not release either Party from any obligations arising under this Agreement.

d. This Agreement shall be deemed to be made under and shall be governed by the laws of the State of Utah in all respects. Each person signing this Agreement warrants that the person has full legal capacity, power, and authority to execute this Agreement for and on behalf of the respective Party and to bind such Party. This Agreement may be executed in one or more counterparts, each of which shall be an original, with the same effect as if the signatures were made upon the same instrument. This Agreement may be delivered by facsimile or electronic mail.

****

IN WITNESS WHEREOF, the Parties hereto have caused these presents to be executed by their duly authorized officers as of the day and year first above written.

ZAYO GROUP, LLC
SUPPLEMENTAL AGREEMENT NO. ___

Supplement to UDOT Finance No. _____

THIS SUPPLEMENTAL AGREEMENT, made and entered into this 30th day of August, 2016, **Utah Department of Transportation**, ("UDOT"), and **Zayo Group, LLC**, a Company in the State of Colorado, ("Company") each as ("Party") and jointly as ("Parties").

The Parties hereto entered in to a Master Utility Agreement (MUA) dated August 30, 2016, UDOT Finance No. _____. All the terms of the MUA remain in full force and effect unless otherwise specified herein.

The Parties agree as follows:

1. UDOT and Company will perform the following described Utility Work in accordance with the terms and conditions of the MUA:

   a. Description of Utility Work to be performed, including proposed location, described in Exhibit "A" that is incorporated by reference: (Plan Sheets Attached)

   b. The Company requirements as shown in the MUA – Company Requirements, are modified as follows:

   c. Anticipated duration of Utility Work as shown on Exhibit "B" that is incorporated by reference:

   d. Betterments included:

TOTAL ESTIMATED COST OF SUPPLEMENTAL AGREEMENT _____	**$0.00**
TOTAL ESTIMATED COST OF COMPANY PERFORMED UTILITY WORK	$0.00
TOTAL ESTIMATED COST OF UDOT PERFORMED UTILITY WORK	$0.00
COMBINED TOTAL ESTIMATED COST OF UTILITY WORK	**$0.00**
TOTAL ESTIMATED AMOUNT OF COMPANY PARTICIPATION @ 50%	$0.00
TOTAL ESTIMATED AMOUNT OF UDOT PARTICIPATION @ 50%	$0.00

2. UDOT will notify the Company's contact person, Michael Sullivan, telephone number (602) 354-9486 and e-mail michael.sullivan@zayo.com at least 48 hours in advance of beginning the Utility Work covered herein, or in accordance with the specific terms of the MUA, as applicable.

IN WITNESS WHEREOF, the Parties hereto have caused these presents to be executed by their duly authorized officers as of the day and year first written above.

SURVEYORS CERTIFICATE

I, LONNIE MERRILL OLSON, DO HEREBY CERTIFY THAT I AM A PROFESSIONAL LAND SURVEYOR, HOLDING CERTIFICATE NUMBER 7736338, AS PRESCRIBED BY THE LAWS OF THE STATE OF UTAH. I FURTHER CERTIFY THAT I HAVE PREPARED THE SURVEY CONTROL DIAGRAM REPRESENTED HEREIN AND THAT THE SAME IS AN ACCURATE REPRESENTATION OF A CONTROL SURVEY, AND WAS CONDUCTED UNDER MY DIRECT SUPERVISION. THE FOLLOWING SURVEY CONTROL MEETS OR EXCEEDS UDOT SURVEY AND GEOMATICS STANDARDS

COORDINATE SYSTEM AND PROJECTION INFORMATION

HORIZONTAL DATUM: NORTH AMERICAN DATUM OF 1983 (NAD83)
VERTICAL DATUM: NORTH AMERICAN VERTICAL DATUM 1988 (NAVD88)
COORDINATE SYSTEM: US STATE PLANE 1983, (2011) UTAH CENTRAL ZONE 4302
EPOCH DATE: 2010
PROJECT UNITS: US SURVEY FOOT
COMBINED SCALE FACTOR: 1.0002259520
SCALE LOCATION: 0,0
FALSE NORTHING: 7,000,000.00
FALSE EASTING: 1,000,000.00
PROJECT HEIGHT: 4500.00
GEOID MODEL: GEOID12A
PROJECT BM: 11400 SO. = PT# 500, 90TH SO. = PT# 548, 70TH AND 5400 SO. = PT# 544.

NOTES

*PRIMARY HORIZONTAL SURVEY CONTROL POINTS WERE OCCUPIED USING RTK OBSERVATIONS POINTS WERE OCCUPIED FOR 180 EPOCHS AND WERE OCCUPIED MULTIPLE TIMES ON DIFFERENT DAYS. THE STATE OF UTAH AGRC'S VRS NETWORK WAS USED FOR HORIZONTAL AVERAGES AND POSITIONS.

*PRIMARY VERTICAL CONTROL WAS ESTABLISHED WITH A SERIES OF DIFFERENTIAL LEVELS BEGINNING AT PT. 500 FOR THE 11400 SOUTH INTERCHANGE, PT. 548 FOR THE 90TH SOUTH INTERCHANGE, AND PT. 544 FOR THE 5400 AND 7000 SOUTH INTERCHANGES. A VERTICAL CALIBRATION WAS THEN PERFORMED USING THE PRIMARY CONTROL POINTS

*SECONDARY VERICAL CONTROL WAS ALSO INCLUDED IN THE DIFFERENTIAL LEVEL LOOPS

*PROJECT COMBINED FACTOR WAS DERRIVED FROM AN AVERAGE OF THE PRIMARY AND SECONDARY CONTROL POINTS

CONVERSIONS

STATE PLANE NORTHING = (PROJECT NORTHING + 7,000,000) / 1.0002259520
STATE PLANE EASTING = (PROJECT EASTING + 1,000,000) / 1.0002259520

WRONG-WAY ARROW PAVEMENT MARKING DETAIL

SEE NOTE 5

NOTES:

1. PLACE A 2 INCH WIDE RED RETROREFLECTIVE STRIP ON ALL OFF RAMP SIGN POSTS ON THE SIDE FACING THE WRONG WAY TRAFFIC. THIS INCLUDES ALL REGULATORY, GUIDE, AND WARNING SIGNS ON THE OFF RAMP.

2. SEE STD DWG SN 7 SERIES FOR MOUNTING HEIGHT AND LATERAL OFFSET REQUIREMENTS.

3. PLACE RED RETROREFLECTIVE SHEETING ON ALL DELINEATION (DELINEATOR POST OR BARRIER MOUNT) ON THE SIDE FACING THE WRONG WAY TRAFFIC.

4. THE WRONG WAY SIGN(S) MAY BE PLACED ON THE BACK OF OTHER OFF RAMP SIGNS AS LONG AS SPACING REQUIREMENTS ARE MET.

5. PLACE A WRONG-WAY PAVEMENT ARROW IN EACH LANE AT THE FIRST WRONG WAY SIGN LOCATION.

6. WHEN THE OFF-RAMP INTERSECTION IS STOP OR YIELD CONTROLLED, USE A 36 INCH DO NOT ENTER (R5-1) SIGN AND EITHER A 48 INCH STOP (R1-1) SIGN OR 48 INCH YIELD (R1-2) SIGN SO AS NOT TO OBSCURE THE STOP OR YIELD SIGN SHAPE.

7. WHEN THE OFF-RAMP INTERSECTION IS SIGNAL CONTROLLED, USE A 48 INCH DO NOT ENTER (R5-1) SIGN.

MEET REQUIRED LIGHTING AND PROVIDE LIGHTING CALCULATIONS IN ACCORDANCE WITH TABLE 1

NOTES:

1. EXTEND THE LIGHTING AREA ON BANGERTER HWY TO PROVIDE CONTINUOUS AND UNIFORM LIGHTING IF THE DISTANCE BETWEEN THE GORE LIGHTING AREA AND THE ADJACENT LANE DROP LIGHTING OR ADJACENT GORE LIGHTING AREA IS LESS THAN 1000 FEET.
2. EXTEND THE LIGHTING AREA ON RAMPS TO PROVIDE CONTINUOUS AND UNIFORM LIGHTING IF THE DISTANCE BETWEEN THE INTERSECTION LIGHTING AREA AND ADJACENT LANE DROP LIGHTING OR GORE AREA LIGHTING IS LESS THAN 500 FEET.

RECLAMATION

Managing Water in the West

Engineering and O&M Guidelines for Crossings

Bureau of Reclamation Water Conveyance Facilities (Canals, Pipelines, and Similar Facilities)

U.S. Department of the Interior
Bureau of Reclamation
Technical Service Center
Denver, Colorado

April 2008

Mission Statements

The mission of the Department of the Interior is to protect and provide access to our Nation's natural and cultural heritage and honor our trust responsibilities to Indian Tribes and our commitments to island communities.

The mission of the Bureau of Reclamation is to manage, develop, and protect water and related resources in an environmentally and economically sound manner in the interest of the American public.

Appendix A General Requirements for Installing Bored and Jacked Pipe Undercrossings

Appendix B Guidelines – Removal of Trees and Other Vegetative Growth from Earth Dams, Dikes, and Conveyance Features (Appendix B of *Review and Operation and Maintenance Program Field Examination Guidelines*)

1.0 PURPOSE

These are general guidelines for Bureau of Reclamation (Reclamation) offices to follow when reviewing the engineering and operations and maintenance (O&M) factors in outside entity requests for authorization to cross (encroach upon) Reclamation lands that contain project features such as levees, canals, pipelines, or other water conveyance facilities owned or administered by Reclamation. These guidelines include a general overview of the permitting process administered by Reclamation Lands Groups for allowing a particular use on lands where Reclamation holds a fee or an easement right-of-way interest. These engineering and construction recommendations are minimum guidelines for engineers to use in reviewing and evaluating these portions of the applications.

2.0 GENERAL PERMIT INFORMATION

Applicants requesting to cross any Reclamation land, facility, or water body must obtain a written land use authorization from Reclamation. Requirements for obtaining a use authorization to cross Reclamation project land and water surfaces are in the Code of Federal Regulations (CFR) at 43 CFR 429 and Reclamation Manual LND 08-01. The applicant must complete the *Standard Form (SF) 29*9, "**Application for Transportation and Utility Systems and Facilities on Federal Lands**," or similar forms in use at the local Reclamation office. The form can be obtained by contacting the involved Reclamation office, or it can be accessed electronically at Reclamation's Web site at: <http://www.usbr.gov/pmts/lands>.

Applicants can contact their local Reclamation office to discuss their proposed use before filing an application for a use authorization.

3.0 ENGINEERING AND O&M REVIEW CONSIDERATIONS

3.1 Introduction

Technical review of the crossing evaluates impacts on any existing Reclamation facility and **does not determine the adequacy of the crossing design for the applicant's intended purpose**.

The use authorization or consent document specifies criteria which, if followed, would not be deemed unreasonable interference. These review guidelines are strictly limited to those criteria which:

- Protect Reclamation's facility and/or appurtenant facility from damage
- Ensure unrestricted flow and quality of water in Reclamation's facility
- Do not diminish the ability to perform O&M of Reclamation's facility, including access
- Prevent any burden of liability

These guidelines are provided as recommendations that apply to most Reclamation facilities. Each Reclamation office and/or authorized operating entity (AOE) should apply these guidelines using **sound engineering judgment** that best applies to their facilities and existing conditions. Additional Reclamation guidelines for specific locations (e.g., Central Arizona Project Reach 11 Basin Guidelines) may also apply and may be provided to applicants when necessary. These guidelines are minimums, and local conditions may be more stringent depending on the direct impacts to facilities and lands. AOEs may have additional requirements.

Uses that may be deemed reasonable within Reclamation pipeline easements include greenbelts, asphalt roadways, flexible pavement parking lots, transverse curbs and gutters, and sidewalks. Canals and pipelines may have overhead power and telephone lines (but not their supporting poles), transverse fences with gated openings (no walls), and similar surface and overhead structures.

3.2 General

The following individual items should be addressed by the applicant and evaluated by Reclamation and/or AOE as they may affect the Reclamation facility's engineering and O&M aspects. If unusual conditions are proposed for the encroaching structure or unusual field conditions within a Reclamation facility right-of-way (ROW) are encountered, Reclamation reserves the right to impose more stringent criteria than prescribed in these guidelines.

1. Structures that should not be constructed on Reclamation pipeline or canal ROW (whether fee owned or easement) include foundations, buildings, garages, carports, trailers, street light standards, supports for large signs, walls, longitudinal fences (except security/safety fences), power or telephone poles, and similar surface structures.

2. Prior to construction, a joint inspection should be conducted and the condition of existing facilities documented. Reclamation's ROW should be restored to pre-existing conditions following completion of work.

3. When applications are requesting public use of trails and maintenance roads adjacent to or crossing Reclamation canals, these facilities should be fenced for safety to separate them from open canal water, except when Reclamation's ROW is used as a greenbelt and the applicant accepts legal hazard responsibility. Trails and maintenance roads should be fenced on an as-needed basis whenever such fencing is warranted for public safety, restricted access, security, etc. If a fence is allowed within Reclamation's ROW, Reclamation should approve the fence materials. Any gates allowed within Reclamation's ROW should be at least 16 feet wide. Reclamation will be provided with full access through any fences or gates.

4. Prior to construction of any structure that encroaches within a Reclamation pipeline or canal ROW, a "pothole excavation" should be made to determine the locations of any existing Reclamation and non-Reclamation facilities and their appurtenant features that may be affected. Potholing is the practice of digging test holes to expose underground utilities to determine the horizontal and vertical location of the utility.

   All work within 18 inches of the facility should be done using hand-held tools only. The excavation should be made by or in the presence of Reclamation and/or AOE personnel. The presence of a Reclamation and/or AOE inspector may be required throughout the excavation process, but this presence in no way relieves the applicant or their contractor of responsibility.

   The resultant elevation information should be delineated on the profile view and labeled as:

   POTHOLED ELEVATION XX.X
   Surface Elevation XX.X

   The pothole excavation should be filled in, or a safety fence installed, prior to departing the site each day.

5. If Reclamation facilities need to be modified to avoid adverse impacts from the applicant's crossing facility, the applicant should be responsible for the cost of such modifications.

6. A temporary permit may be required for visual inspections, ground and aerial surveys,[1] or potholing that requires physical entrance onto a Reclamation facility. **A use authorization or consent document issued by Reclamation and/or AOE should be obtained prior to entering or crossing Reclamation's ROW for any activity**.

7. Applications should include a project description, calculations, specifications, and detailed construction plans showing plan views, profiles and sections, and grading plans of proposed work within or adjacent to Reclamation's ROW. Plans should show an easily recognizable boundary (tied to a known corner) and Reclamation's ROW and Reclamation stationing or mile post designation.

   All Reclamation facilities should be shown and labeled (e.g., "Centerline of xx-inch Reclamation Pipeline," "Reclamation Communication and Control Cable," etc.) The type and weight of the construction equipment crossing Reclamation pipelines, roads, and bridges as well as the crossing locations should be included. Additional information, as identified in following individual specific feature sections of these guidelines, should also be included with the application for review.

   Any engineering or land survey drawing should contain the appropriate registered engineer's or land surveyor's stamp and signature. A construction schedule outlining the anticipated duration of the construction should be submitted. A minimum of two[2] copies of the application (including calculations, specifications, and plans) should be submitted to Reclamation and/or AOE for review and approval.

8. For crossings of all Reclamation facilities, Reclamation and/or AOE personnel familiar with the facilities (including cathodic protection systems) will obtain and provide copies of existing files showing information about existing buried facilities (center of pipeline, depth of cover, size of pipe, class of pipe, etc.) to the applicant.

9. Existing Reclamation facilities (e.g., canal lining, canal check structure, turnout structure, etc.) and appurtenances (e.g., existing blow-offs, air valves, vents, manholes, and/or cathodic protection test stations) and existing non-Reclamation facilities on Reclamation's ROW (e.g., petroleum pipelines, natural gas pipelines, communications lines, powerlines, water lines, sewer lines, storm drain lines, etc.) **should be protected** in place prior to and during construction.

[1] Aerial surveys require placing on-the-ground survey control markers.
[2] Revise per local Reclamation office and/or AOE practice.

The applicant and/or their contractor may be liable for all damages to Reclamation facilities and appurtenances as a result of construction and for any other damages or losses suffered by Reclamation or its water contractors, including power, irrigation, municipal and industrial water supply, and communication losses.

10. Trench excavation should comply with the most current Occupational Safety and Health Administration standards or Reclamation Health and Safety Standards, whichever are more stringent. Trench backfill should be placed in 4- to 6-inch lifts if hand compacted or no more than 8-inch lifts if power compacted. Trench backfill within Reclamation's ROW should be compacted to 95 percent relative compaction (ASTM D 698, Standard Proctor) (or 90 percent of ASTM D 1557). Mechanical compaction using heavy equipment (greater than 2,000 pounds) should not be used within 18 inches of the Reclamation pipeline. Flowable fill (or controlled low strength material) should be substituted for compacted pipe embedment under canals and may be used when crossing pipelines.

11. Erosion control measures, including re-vegetation, should be implemented after completing construction.

12. If existing drainage features are to be modified during construction, detailed drawings showing the proposed drainage replacement/ restoration should be submitted with the application for review and approval. The applicant is responsible for the care and handling of storm water runoff both during and after construction.

13. The applicant should not divert surface runoff[3] toward Reclamation canal or canal embankments. The 100-year storm[4] surface runoff should use detention basins outside of Reclamation's ROW. Lined drainage channels should be designed to transfer flow from the detention basins to the existing cross drainage facilities that drained the original area. Also refer to "4.4 Storm Water Cross Drainage."

14. Proposed temporary or permanent modifications to the existing cover over Reclamation pipelines should be subject to review and approval by Reclamation and/or AOE. Design parameters for roadway, parking lot, and driveway crossings over the pipe should also be subject to review and approval by Reclamation and/or AOE.

[3] Subdivision or commercial development on the uphill side of canals that pave large areas and have large roof areas will greatly increase peak storm runoff—most city development requires retention basins. Applicants should provide the same retention basins that are required for similar development projects.

[4] Revise per Reclamation field office for specific canal if a higher storm frequency is required.

15. When a Reclamation pipeline system being crossed has pipe with an "A" cover pipe designation (less than 5 feet of earth), the applicant is to analyze the crossing to show "A" pipe load carrying capability exists to meet their carrying requirements or replace the "A" pipe with pipe of sufficient load carrying capability.

16. Reclamation's ongoing O&M activities should not be disrupted during construction. The primary or secondary operating road should be kept available for Reclamation and/or AOE use at all times.

17. Detectable warning tape may be required over below-ground utilities. Refer to "3.3 Detectable Warning Tape."

18. The points where the proposed utilities enter and exit Reclamation's ROW should be plainly and permanently marked by sign posts extending 5 feet above grade. Applicants should provide sign posts directly above their utilities and at all angle points within Reclamation's ROW. The distance between adjacent sign posts should not exceed 500 feet. Sign posts should contain the name of owner/operator, contents of the pipeline, utility identification, and emergency contact telephone number. Sign posts for angle points that lie within roads or canals should be offset and have a reference noted. The locations of the sign posts should be shown on the plans.

19. Following completion of work, applicants should provide as-built drawings of their facilities on Reclamation's ROW. Reclamation as-built drawings are to be updated by the appropriate Reclamation office and/or AOE to reflect the crossing. As-built drawings may be maintained by the AOE, but should remain accessible to Reclamation upon request.

3.3 Detectable Warning Tape

Detectable warning tape may be required over below-ground utilities situated within Reclamation's ROW and should be a minimum of 18 inches above the utility and between 18 and 30 inches below the ground surface. Warning tapes should conform to the following specifications:

a. For potable water lines, the warning tape should be a 3-inch-wide blue detectable tape imprinted with "**CAUTION BURIED POTABLE WATER LINE**."

b. For nonpotable water lines, the warning tape should be a 3-inch-wide purple detectable tape imprinted with "**CAUTION BURIED NONPOTABLE WATER LINE**."

c. For sewer and storm drain lines, the warning tape should be a 3-inch-wide green detectable tape imprinted with "**CAUTION BURIED (type) LINE**."

d. For gas, oil, and steam chemical lines, the warning tape should be a 3-inch-wide yellow detectable tape imprinted with "**CAUTION BURIED (type) LINE**."

e. For telecommunications, telephone, and television conduit(s), the warning tape should be a 3-inch-wide orange detectable tape imprinted with "**CAUTION BURIED (type) CONDUIT**."

f. For electrical, street lighting, and traffic signal conduit(s), the warning tape should be a 3-inch-wide red detectable tape imprinted with "**CAUTION BURIED (type) CONDUIT**."

4.0 SPECIFIC FEATURE REVIEW GUIDELINES

4.1 Bridges

1. New bridge crossings (vehicular, pedestrian, and utility) should be perpendicular (between 70 and 90 degrees) to the centerline of the water conveyance facility and at locations approved by Reclamation and/or the AOE. Exceptions to the policy may be considered on an individual basis.

2. Public use bridges in urban areas should be spaced no closer together than 1/3 mile (about 4 blocks or 1,700 feet) apart. This is to ensure O&M operations are not overly restricted.

3. Bridge crossings should be of free span design. Consideration of any anticipated (known or ongoing) canal subsidence issues, anticipated raising of the canal lining, or anticipated increases in the canal's high water level should be made. The minimum vertical clearance between the bottom of the superstructure and the top of the canal lining should be 3 feet. For unlined canals, the vertical clearance may be measured to the high water level. If this minimum clearance is reduced by subsidence or by future Reclamation modifications to the canal lining, the minimum clearance should be re-established at the applicant's expense. The minimum horizontal clearance from the face of the abutment to the top of the canal lining should be 5 feet. For unlined canals, the horizontal clearance may be measured to the high water level.

These clearances are suggested to minimize impact on the canal section during construction and future inspections and O&M. Applicants may request to re-construct a canal section if Reclamation's operations are impacted by close construction during periods when the canal is normally unwatered. If so, vertical clearances may be reduced to 1 foot and horizontal clearance to 3 feet.

4. Canal O&M roads should intersect public roads at bridges at right angles for proper visibility. This may require the applicant to acquire additional ROW for use if the existing canal ROW is not sufficient. American Association of State Highway and Transportation Official (AASHTO) criteria for sight distances at the intersection of O&M roads and roadways at new bridges should be met to allow O&M vehicles to cross them safely.

5. Driving piles at concrete-lined canals should not be permitted. Any abutment foundation support piles, at concrete-lined canals, should be drilled and cast-in-place.

   At a minimum, the applicant's drilling and piling plan should include:

   - Drilling methods and equipment
   - Methods for preserving existing foundation material
   - Methods and equipment to determine the presence of quick soil conditions or scouring and caving
   - The proposed method for casing installation and removal if casings are used
   - Methods and equipment for accurately determining the depth of concrete and actual or theoretical volume placed

   At a minimum, the applicant's contingency plan should include:

   - Means to repair in a certain time
   - Minimum flows after event
   - Review of geotechnical conditions surrounding the pile locations
   - Assessment of how the proposed mitigations will address geotechnical conditions
   - Methods for restoring foundation material

- A list of material, equipment, and personnel with qualifications to be used during mitigation work

- A seal from a Professional Engineer on all relevant plans and drawings

6. The submitted plan drawings for the bridge should contain the following information:

    a. Superstructure, abutments, railings, embankments, and drainage, including details and sections

    b. Type of materials (concrete, steel, timber, etc.) used for different members

    c. Details of cast-in-place foundation piles, if any, on both sides of the canal

    d. The elevation of the bottom of the superstructure and the clearance between the top of the canal lining (or high water level if unlined canal) to the superstructure or bottom of deck slab, whichever is lowest

    e. Design loadings

    f. Design standards on which the bridge is based (AASHTO, etc.)

7. The calculations and specifications for the bridge should be submitted to Reclamation and/or AOE for review.

8. The right lane turn radius from the new road onto a Reclamation operating road should comply with the provisions of a 67-foot wheelbase[5] (WB-67) truck turning template in the AASHTO manual on Geometric Design of Highway and Streets.

9. Details of any proposed utilities to be attached to an existing bridge include:

    a. Anchor bolt locations should not intercept the critical reinforcing steel of the bridge.

[5] The field office should adjust these provisions according to anticipated needs.

b. Utilities should be placed and anchored under bridge decks and through utility openings, if they are present. The utility should be placed off center in the utility opening, if possible, to allow for future utility additions.

c. If an expansion joint is used in the pipeline, the joint should be placed near the bridge deck expansion joint.

d. Holes through bridge concrete or abutment and retaining walls for passage of utilities should be allowed by core drilling. The annular space between the utility and core hole surface should be completely filled with an elastomeric sealant to prevent loss of material or water piping from behind the wingwalls and abutments.

e. Submit calculations showing the effects of the weights of the proposed utilities on the load carrying capacity of the bridge for Reclamation review.

f. Intermediate supports for the utility should withstand the same seismic load considerations as the bridge.

g. Load limit signs should be placed adjacent to the bridge, as required under AASHTO criteria.

h. Beam guardrails should be installed at bridges and bridge approaches, as required under AASHTO criteria.

10. The applicant will be responsible for changes to Reclamation existing ROW; bridge O&M approach roads; existing fencing, gates, and signs; and the addition of new fencing, O&M gates, cattle guards, signs, etc.

4.2 Landscaping

1. No landscaping or other changes in ground surfaces within Reclamation pipeline and canal/lateral ROW should be made without advance written permission of Reclamation through the application process. Landscaping changes may (1) limit, prevent, or hamper O&M access; (2) increase the costs of operations and maintenance of the facility; (3) impact facility reliability; or (4) create a public nuisance or liability issue.

2. Open space with natural hiking trails and walkways may be permitted if vehicle access to Reclamation pipeline and appurtenant facilities for patrol and maintenance is provided.

3. The following may apply within Reclamation's ROW:

    a. The easement may be used as a greenbelt upon Reclamation approval.

    b. Ground cover and shrubs are permitted upon Reclamation approval.

    c. Trees and vines should not be allowed. See Appendix B of *Review of Operation and Maintenance Program Field Examination Guidelines* (reproduced as appendix B at the end of these guidelines).

4. All temporary or permanent changes in ground surfaces within Reclamation pipeline and canal ROW are considered encroaching structures and are handled as such. Earthfills and cuts on adjacent property should not encroach onto Reclamation pipeline and canal ROW. Excavations of adjacent property (even property not within Reclamation's purview) within the projection of the Reclamation embankment line may impact embankment stability and should be evaluated.

5. Permanent landscaping structures should not be allowed within the exterior limits of a Reclamation linear facility ROW (fee owned or easement).

6. Pressurized lawn and park sprinkler irrigation lines (3-inch maximum size) and isolation valves within Reclamation easements that run parallel to a Reclamation pipeline should be installed at least 15 feet from the edge of the Reclamation pipeline.

    Irrigating lawns and flower beds along canal embankments should not overwater the area or threaten the embankment stability.

4.3 Roadway Crossing

Note: This type of encroachment also includes parking areas and recreational trails.

1. The applicant should submit a grading plan as part of the application.

2. If the roadway crosses a Reclamation pipeline system that has a cover pipe designation of "A," refer to "3.2 General."

3. If the applicant intends to modify existing drainage features during construction, detailed drawings showing the proposed drainage replacement/restoration should be submitted with the application for review and approval. (Refer to "3.2 General.")

4. If the proposed roadway includes a bridge crossing over a Reclamation canal or pipeline, Reclamation and/or AOE should review and approve the vertical clearance and location of the abutments. (Refer to "4.1 Bridges.")

5. Streets, roads, or parking areas crossing Reclamation pipeline easements are permissible. All streets, roads, and parking surfaces are to be asphalt or other flexible pavement. Depressed curbs or driveways should be provided for Reclamation vehicular access when new roads cross Reclamation pipelines or canals.

6. Roadway ditch drainage should not be allowed to flow into the canal. Drainage should be retained and released in a controlled way to maintain peak discharges that are less than any peak historical runoff rate before these modifications. Applicants should direct drainage to an original sub-basin cross drainage culvert or overchute. (Refer to "3.2 General" and "4.4 Storm Water Cross Drainage.")

7. If existing roadway embankments are to be widened, the work should be conducted in accordance with the provisions of construction in the applicable State Department of Transportation (DOT) Standard Specifications.

4.4 Storm Water Cross Drainage

1. Upslope development impacts historic natural drainage volumes and peak flow rates. Development re-grades and revises drainage sub-basins. Revised ground cover from constructing roads, parking areas, and buildings may result in the need to change the cross drainage features (culverts and/or overchutes) along Reclamation canals.

2. A hydrologic study should accompany all plans that modify the existing drainage across and/or along Reclamation facilities. The study or report should show the proposed flows of the canal and the associated crossings. The drainage study or report should show that the downstream system can accept the flows without creating any flooding to properties adjacent to or downstream of the canal.

3. All drainage crossings, whether existing or proposed, should carry the peak runoff of a 100-year event while preventing any storm water from entering the canal and/or ponding against the canal embankment.

4. Urban runoff should not be allowed to enter into, or drain onto, Reclamation's land. All flows generated outside Reclamation's ROW should enter the storm drain system prior to entering Reclamation's ROW. Piped connections are preferred, but concrete-lined channels may be acceptable upon Reclamation's review.

5. The new crossing under a canal should be designed with 3 feet vertical clearance from the top of the cross drainage structure to the bottom of the canal (or liner). The structure should extend completely across Reclamation's ROW.

6. New overcrossings of the canal should have 2 feet of vertical clearance from the top of the liner and 2 feet of horizontal clearance from the support abutments to the outside edge of the canal lining. The O&M road crossing of the cross drainage structure should be structurally capable of withstanding highway-legal vehicle loadings and provide at least 1 foot of cover in the roadway.

7. Pipe crossing barriers should be installed on all pipe overcrossings.

8. All drainage flow should be discharged to a downstream storm drainage system owned, operated, and maintained by a public agency (such as a city or county) or into areas such as channels, roadways, parks, wetland basins, or other non-private lands that can accept the concentrated flows from the drainage crossing.

9. All drainage from upland property should be collected by the applicant's installed system of curbs and inlets within their property and discharged into a non-Reclamation public agency's drainage system.

10. New drainage system designs will not use ponding against the existing canal embankment for temporary detention of storm runoff that will not immediately pass through existing or new crossings.

    Proposed permanent detention facilities adjacent to Reclamation's property should include engineered fill beyond the canal ROW to provide, at a minimum, a fill-width maintenance access roadway between the canal property and the basin. The applicant shall submit a geotechnical report verifying that the canal embankments can perform as detention basin embankments. The design should provide for sufficient freeboard to contain the 100-year event within the proposed basin adjacent to Reclamation's property and shall have adequate protection from seepage and erosion.

    The ownership and related O&M of the embankments shall be the responsibility of the applicant requesting the crossing.

11. When grading operations upstream of existing canal drainage crossings are scheduled to take longer than a normal construction season to complete, temporary basins shall be installed. These temporary basins should be designed to detain the 100-year event, capture silt from the disturbed area, and meter the flows across the existing drain crossings without spilling flows into the canal.

12. Unless Reclamation specifies otherwise, the applicant should remove or plug and abandon existing drainage crossings that are not used by the development unless they are shown to provide an additional measure of safety for the canal by reducing the likelihood of spill into the canal caused by extreme runoff flows. Otherwise, these crossings should remain in place for Reclamation's benefit and will not require ownership transfer to a public agency.

    These crossings must discharge into the non-Reclamation public agency's storm drainage systems or into areas such as channels, roadways, parks, wetland basins, or other nonprivate lands that can accept the concentrated flows from the drainage crossing in the case of an extreme runoff event.

    Grading in Reclamation property should be preserved or revised to direct extreme runoff flows into these unused drainage crossings without allowing said flows to enter into the canal until the crossings reach their capacity.

4.5 Subdivision

Urban developments are reaching Reclamation's lands and ROWs. These are general guidelines for accommodating development in subdivisions (refer to "3.2 General" and "4.4 Storm Water Cross Drainage").

1. Permanent structures should not be permitted within Reclamation fee-owned linear ROWs.

2. Open space with natural hiking trails and vegetation may be allowable.

3. Where subdivision development is adjacent to a canal, fencing should include these characteristics:

    a. Temporary chain link fences must be installed prior to removing any portion of existing fences.

b. Upon completion of grading for drainage and other work, fencing should be installed along the subdivision's boundary length of the adjacent ROW plus 150 feet beyond the development's property boundary. The fence should be per project standards and at the applicant's expense.

c. The new fence should be located 1 foot outside of Reclamation's ROW. The fence location should be shown on the improvement plans.

4. Use of Reclamation pipeline easements as part of residential subdivision lots should not be allowed. Pipeline easements may be included within the subdivision greenbelt or similar use areas.

5. Drawings should include all proposed improvements (i.e., streets, utilities, landscaping, etc.) within, and adjacent to, Reclamation's ROW.

6. Trees or vines should not be allowed within a Reclamation pipeline or canal ROW. See Appendix B of *Review and Operation and Maintenance Program Field Examination Guidelines* (reproduced as appendix B at the end of these guidelines).

7. Streets, roads, or parking areas using Reclamation easements may be permissible. All streets, roads, and parking surfaces should be asphalt or other flexible pavement. Depressed curbs or driveways should be provided for Reclamation vehicular access when new roads cross Reclamation pipelines or canals.

8. Where fencing is proposed within Reclamation easements, a minimum 16-foot-wide gate should be provided for Reclamation access.

9. Pipelines containing sewage, oil, gasoline, natural gas, or hazardous materials should only cross perpendicular (between 70 and 90 degrees) to the Reclamation pipeline or canal and be installed with the necessary safety measures and separation clearance as required in "4.6 Utility Crossing."

10. Electroliers, posts, etc., should be installed at the maximum distance possible from the edge of the pipeline or canal.

11. If crossing a Reclamation pipeline system that has "A" cover pipe designation, refer to recommendations in "3.2 General."

4.6 Utility Crossing

Note: All pipelines, electrical, and communication lines and conduits are referred to as "utilities" in these guidelines.

4.6.1 Casings

The Reclamation Materials Engineering and Research Laboratory's (MERL) position is to avoid using casing pipes around metallic carrier pipelines (steel, ductile iron, cast iron, reinforced concrete, pretensioned concrete cylinder, etc.) whenever possible. The experience of the corrosion community in general is that these casings often cause corrosion-control problems. Furthermore, dielectric (plastic, fiberglass, etc.) casings, or even dielectrically coated casings, should not be used. They can shield the carrier pipe from receiving cathodic protection current.

Cathodic protection to a buried metallic pipeline is more trouble free and more certain without a casing pipe. MERL recommends relying on effective corrosion control measures on the carrier pipeline rather than relying on a casing pipe (which may shield cathodic protection current) to direct a leak away from Reclamation property.

4.6.2 Overhead Line Crossing

1. Overhead wires across Reclamation pipeline and canal ROWs should be at least 32 feet above all ground levels in the Reclamation ROW. For electrical powerlines of 69 kilovolts (kV) or higher voltage, the minimum clearance should be 40 feet plus 0.25 inch per kV of line-to-line voltage above 450 kV. In any case, the minimum clearance is to be that determined to be needed with an ambient temperature of 120 degrees Fahrenheit.

2. Reclamation has the following requirements for overhead crossings:

    a. Poles or towers should not be allowed within Reclamation's ROW.

    b. Overhead electrical and communication lines should cross perpendicular (between 70 and 90 degrees) to the centerline of the Reclamation facility.

    c. If necessary, fence grounding is to be provided for existing fence lines, especially under power transmission lines.

3. A marker warning sign should be provided that shows the clearance and electrical line voltage. The warning sign should face oncoming traffic and state, "**DANGER, HIGH VOLTAGE OVERHEAD**."

4.6.3 Utility Crossing Reclamation's Canal

Utility crossings include open ditch laterals, subsurface and surface drains, levees, and similar facilities.

General Requirements:

1. Utilities crossing Reclamation canals should be designed to cross perpendicular (between 70 and 90 degrees).

2. Pier construction in the canal for new utility crossing(s) should not be allowed. New utility crossings should be free span design.

3. Open cut crossings of Reclamation canals and ditches, when allowed, should require replacing linings to re-establish the original construction style and materials (i.e., disturbed concrete lining panels should be removed in their entirety and replaced, membrane lining and earth or concrete protective cover should be re-constructed, gravel and canal under-drainage systems should be re-established to full working order, etc.) Proposals should be submitted for approval with the crossing permit application.

4. For trench excavation and backfill requirements, refer to "3.2 General."

5. Boring and jacking of a utility through canal embankments or protective levees should not be permitted. Boring and jacking of a utility should be constructed through the embankment foundation materials. Applicants should make special design and construction considerations with bored crossings under canals containing water during construction. Among these should be using proper bentonite slurry to seal the annulus space between the utility conduit and the boring cavity from canal seepage. Refer to appendix A for more details to be considered.

   The applicant's drilling plan should cover:

   a. Drilling methods and equipment

   b. Methods for preserving existing foundation material

   c. Methods and equipment to determine the presence of quick soil conditions or scouring and caving

d. Proposed method for casing installation and removal if casings are used

e. Methods and equipment for accurately determining the depth of concrete and actual or theoretical volume placed

The applicant's contingency plan should cover:

a. Means to repair in a certain time

b. Minimum flows after event

c. Review of geotechnical conditions surrounding the pile locations

d. Assessment of how the proposed mitigations will address geotechnical conditions

e. Methods for restoring foundation material

f. List of material, equipment, and personnel with qualifications to be used during mitigation work

g. A seal from a Professional Engineer on all relevant plans and drawings

6. When horizontal directional drilling (HDD) or other trenchless methods are used, canal seepage conditions may be aggravated by the collapse of the canal foundation material into the annular void between the bore and pipe. Penetration through the top stratum of fine-grained materials may concentrate seepage at those locations. Pipe installed with trenchless methods should proceed only after completion of a comprehensive evaluation of the following:

(a) Comprehensive understanding of the subsurface soil and groundwater conditions to a minimum depth of 20 feet below the lowest pipe elevation

(b) Locations of the HDD pipe penetration entry and exit

(c) Construction procedure

(d) Allowable uplift pressures

(e) Onsite quality control and quality assurance monitoring during construction operation

(f) Grouting of the pipe annulus

(g) Backfilling of any excavated areas

(h) Repair and reinstatement of the construction staging areas

A geotechnical report should be submitted with the application for review prior to approval of the proposed utility crossing.

Directional drilling under a canal may be considered if a minimum clearance of 25 feet to the bottom of the canal lining is maintained for utilities with less than a 24-inch outside diameter. Larger utility crossings should be considered on an individual basis and may require additional clearance from the bottom of the canal lining.

7. Cut and cover constructed utilities under Reclamation canals should have a minimum cover of 36 inches when within Reclamation's ROWs. Bored construction utilities should have a minimum of 3 diameters cover.

8. Reclamation's ongoing O&M activities should not be disrupted during crossing construction. The primary or secondary operating road should be kept available for Reclamation use at all times.

9. Canal embankments should be re-built or repaired with materials and standards equal to or better than the existing embankments.

10. Drawings should be stamped and signed by a Professional Engineer and contain the following information:

    a. Canal milepost or station at each proposed crossing, utility size and location, and type of utility or material transported

    b. Maximum utility operating pressure, type of pipe, joints, wall thickness, maximum test pressure, and description of test procedures

    c. Type of sleeve/casing (when allowed) including diameter, joints, and wall thickness

    d. For utilities attached to a bridge or an overchute, details showing the structure name, superstructure, abutments, embankments, protective dikes, method of attachment, spacing of utility supports on the structure, location of other attached utilities, and structural calculations

e. Protective coatings and corrosion control measures

f. Method of handling pipeline expansion and contraction

g. Location of nearest shutoff valve on each side of the crossing

h. Location and details of thrust restraint

i. Design code(s) used for the utility crossing

j. Location, including depth, of the buried pipeline communication and control cables

k. Other existing utility easements in the immediate vicinity

Hazardous Material Carrier Requirements:

1. Pipelines carrying hazardous material or pollutants (e.g., oils, gasoline, sewage, contaminated waters, and nonpotable waters) should be designed for a reduced risk of failure in the portion within Reclamation's ROW. The design should require either:

    a. Designing the crossing pipeline with an additional 50 percent working pressure factor

    or

    b. Using secondary containment (casing pipe) for all hazardous material pipelines

2. To minimize the amount of any hazardous material entering the canal, Reclamation may require the installation of a block (gate) valve and or a check valve on each side of the canal between the ROW boundary and the embankment. When selecting the type of the valves, take into the account the flow direction and the terrain.

3. A final hazardous material spill contingency plan and an emergency response plan should be approved by Reclamation prior to start of construction.

4. A monitoring program and/or Supervisory Control and Data Acquisition System alarm may be required depending on the hazardous material transported. This applies to all "overcrossings" and "undercrossings" when the hydraulic grade line is within 60 inches of the canal liner or when local geology would promote this requirement.

Attaching Utilities to Bridges and Overchutes:

Note: Reclamation does not guarantee the long-term availability of bridges or overchutes as support devices for utility crossings because they may require structural modifications or alterations to accommodate widening, repairs, subsidence offsets, etc., to such an extent that service may be interrupted or stopped. Reclamation may determine the bridge is no longer required and may remove it. In that event, the owner/operator of each utility attached to a bridge or an overchute may be required to re-locate or permanently remove their utility at their own expense.

Specific details for attaching utilities to bridges are:

a. Utilities should not be placed on the bridge deck.

b. Anchor bolt locations should not intercept the critical reinforcing steel of the bridge.

c. Utilities should be placed and anchored under bridge decks between girders and through utility openings, if they are present. The utility should be placed off center in the utility opening, if possible, to allow for future utility additions.

d. If an expansion joint is used in the pipeline, it should be placed near the bridge deck expansion joint.

e. Holes through bridge concrete or abutment and retaining walls for passage of utilities may be allowed and should be core drilled. The annular space between the utility and core hole surface should be completely filled with an elastomeric sealant to prevent loss of material or water piping from behind the wingwalls and abutments.

f. Calculations showing the effects of the weights of the proposed utilities on the load carrying capacity of the bridge should be submitted for Reclamation review.

g. Intermediate supports for the utility should withstand the seismic conditions of the bridge.

4.6.4 Utility Crossing Reclamation's Underground Pipelines

1. The applicant should submit the procedures, excavation plans, schedules, as well as type and weight of the construction equipment to be used for crossing the Reclamation pipeline.

2. High voltage, direct current powerlines should not be permitted to encroach on the Reclamation pipeline ROW, except in unusual circumstances and with proper cathodic protection considerations.

3. For proposed metallic pipelines, refer to "5.0 Cathodic Protection Requirements."

4. For utilities crossing above or under the Reclamation pipeline, the vertical clearance between the utility and Reclamation pipeline should be a minimum of 12 inches.

5. The location of the Reclamation pipeline and the communication and control cables throughout the area of the proposed construction should be shown on the plans. Prior to Reclamation and/or AOE issuing a use authorization or consent document, the pipeline and the cable(s) should be located and exposed by potholing. The pothole locations should be shown on the drawings. The pothole elevations should be referenced to Reclamation stationing or milepost. (Refer to "3.2 General.")

6. Drawings should contain the following information:

    a. Reclamation milepost or station at each proposed crossing, pipeline size and location, and type of utility or material transported.

    b. Maximum utility operating pressure, type of pipe and joints, maximum test pressure and description of test procedures, wall thickness, and utility pipe classification.

    c. Type of sleeve/casing pipe (when allowed) including diameter, joints, and wall thickness.

    d. Protective coatings and corrosion control measures.

    e. Location of nearest shutoff valve on each side of the crossing.

    f. Location and details of thrust restraint.

    g. Design code(s) used for utility crossing.

    h. Location, including depth of the Reclamation pipeline and the communication and control cables.

    i. Other existing utility easements in the immediate vicinity.

7. Detectable warning tape may be required over trenched utilities. (Refer to "3.3 Detectable Warning Tape.")

8. For trench excavation and backfill requirements, refer to "3.2 General."

9. Embankments should not be permitted within Reclamation's ROW where underground pipeline exists.

4.6.5 Utility Crossing Under Reclamation's Roadways

1. The applicant should supply typical cross sections that show existing ground surface elevations, utility trench invert elevations, and utility details.

2. For trench excavation and backfill requirements, refer to "3.2 General."

3. Conduits with diameters up to 24 inches should be bored and jacked underneath pavements. Larger conduits may be considered on an individual basis. Pavement or road surfaces should not be cut unless an acceptable detour, if required, is approved. The cover over the conduit(s) when within Reclamation's ROWs should be a minimum of 36 inches. (Refer to "3.2 General.")

4. Unless otherwise approved, the applicant should replace existing Reclamation roads and parking surfaces that are removed or damaged by the applicant's construction activities in accordance with provisions in the latest edition of the applicable State DOT Standard Specifications.

5. If existing road embankments are to be widened, the work should be conducted in accordance with the provisions of embankment construction in the applicable State DOT Standard Specifications.

6. Detectable warning tape may be required over buried utilities. (Refer to "3.3 Detectable Warning Tape.")

5.0 CATHODIC PROTECTION REQUIREMENTS

5.1 Cathodically Protected Metallic Pipelines

Unless approved in writing by Reclamation, metallic pipelines or those containing metallic reinforcement (e.g., reinforced concrete) installed within Reclamation's ROW should have a suitable bonded dielectric coating (see "5.2 Protective Coatings for Corrosion Control") and be cathodically protected. Impressed current cathodic protection rectifiers and deep-well anode systems should not be

permitted within Reclamation facilities without prior approval from MERL's Corrosion Technology Group. All submittals should include details of the cathodic protection system (CPS) and its appurtenances.

1. All existing Reclamation cathodic protection test stations, cables running to these stations, rectifiers, anode beds, and any other appurtenances should be located prior to any grading or excavation. The test stations should be staked and flagged. The test stations, cables running to these stations, any anode beds, etc., should be suitably enclosed or protected during construction to prevent damage. No re-location or modification of the test stations, cables, anode beds, etc., is allowed without prior approval from MERL's Corrosion Technology Group.

2. Generally, the CPS to the proposed pipeline should be the sacrificial anode type unless the proposed installation continues an existing pipeline that uses impressed current type of cathodic protection.

3. A means of monitoring the effectiveness of the CPS on the proposed pipeline should be provided within Reclamation's ROWs. The number of anodes and test stations will differ with each project. Test stations should be located at every anode bed connection and should not be more than 1,000 feet apart. A test station should also be located where any metallic pipeline crosses over or under a metallic Reclamation pipeline, metallic fence, other metallic structure embedded in the ground, or comes within 20 feet of a Reclamation structure on or embedded in the ground. Both the proposed cathodically protected pipeline and the Reclamation pipeline should be monitored regularly using these test stations. Monitoring results should be reported to MERL's Corrosion Technology Group. In addition, the owner of the proposed crossing pipeline should investigate and mitigate any adverse potential shift caused by the proposed pipeline on the Reclamation pipeline. Owners of proposed crossing pipelines should return Reclamation pipelines to their original electrochemical potentials or to more benign potentials. Mitigation measures should be approved by MERL's Corrosion Technology Group. The effectiveness of mitigation measures should be confirmed in the presence of a Reclamation representative following installation.

   For those pipelines under DOT regulation, the application and monitoring of the CPS should conform to Title 49 CFR, Part 195, any special provisions of this guideline, and the provisions of NACE International RP 0169, in that order. For other pipelines, any special provisions of this guideline should take precedence, followed by the provisions of NACE RP 0169.

5.2 Protective Coatings for Corrosion Control

1. *Atmospheric Exposed Pipe*

   The coating should be a high build modified aluminum epoxy mastic primer and top coated with a high build aliphatic urethane. The type of coating should be listed in the submitted plans and specifications. Information should include the surface preparation and the thickness of the coating to be applied.

2. *Buried Pipe*

   The type of coating may vary from project to project due to geology and soil corrosivity and should be considered on an individual basis. The type of coating should be listed in the submitted plans and specifications. Information should include the surface preparation and the thickness of the coating to be applied.

GLOSSARY

Bored and jacked – This terminology is a general way of referring to a family of trenchless methods.

Bridge, class A – Vehicular bridge used by the public. May or may not be owned by the Bureau of Reclamation.

Consent Document Permit – Permit required across fee-owned lands.

Detention basin – An artificial flow control structure used to contain flood water for a limited period of a time, thereby providing protection for areas downstream. Detention basins provide a way to reduce storm peak flows, while retention basins hold water for an extended period of time. These basins are generally a part of a larger engineered flood water management system.

Electroliers – A branching frame, often of ornamental design, used to support electric illuminating lamps.

Pothole excavation – See potholing.

Potholing – The practice of digging test holes to expose underground utilities (e.g., cables) to determine the horizontal and vertical location of these utilities.

Trenchless methods – Procedures for installing pipe without using traditional trench cut and cover methods. These trenchless methods may be referred to as bore and jack, tunneling, horizontal directional drilling, and microtunneling, among others.

Water conveyance facility – Canal, ditch, pipeline, drain, levee, open or closed laterals, and similar facilities and their associated appurtenant features.

Appendix A

General Requirements for Installing Bored and Jacked Pipe Undercrossings

Bored and Jacked Under the Canal – This terminology is a general way of referring to a family of trenchless technologies. Similar guidance to the requirements listed below should be followed no matter what method is used for installation.

1. Installing a lone carrier pipe (without casing) is encouraged. Refer to "4.6 Utility Crossing," and "4.6.1 Casings" for information on cautions of using casings around metallic carrier pipe.

2. Plans must show carrier/casing pipe type, diameter, and thickness. Casing pipes should be steel pipe (American Water Works Association [AWWA] C-200) and have 1/4-inch minimum wall thickness. Applicants should provide the type of carrier pipe and appropriate bell dimensions for said carrier pipe to verify annular clearances.

3. When installing pipe while the canal is unwatered, a minimum of 3 pipe diameters or 60 inches of clearance (whichever is greater) between the top of the pipe and the bottom of the canal must be maintained. However, 72 inches or more clearance is recommended.

4. Provide a minimum of 3 inches of clearance between the carrier and casing pipes at all points (including bells).

5. A bulkhead or effective sealing device should be provided at both ends of each casing pipe to seal the annular space between the two pipes. Vent pipe should be included to allow ventilation and reduce the risk of condensation buildup and flooding.

6. As a result of the installation process, an annular void is usually created around the outside of the casing pipe. Provisions should be made to pressure grout or effectively seal (e.g., bentonite slurry) this void space.

7. Requirements below are provided to establish minimums for determination of the length of pipe to be installed. It is strongly recommended that pipes be installed perpendicular (between 70 and 90 degrees) to the canal alignment. Regardless, the pipe must extend completely through the Bureau of Reclamation's (Reclamation) right-of-way (ROW). Theses minimums do not relieve the applicant's engineer from performing an onsite investigation or other work to determine local conditions that may require additional pipe length.

   Jacking pit configuration, location, and length of pipe to be installed should be based on the following parameters:

   a. One operating road shall remain open to vehicular traffic at all times.

b. The minimum operating road embankment top width to be maintained during construction should be either 14 feet wide, the width of the existing embankment, or as required by Reclamation.

c. As a minimum, jacking pit excavations should not be within:

(1) A line drawn from the outside edge of the operating road embankment extended downward and away from the canal at a slope of 3/4 horizontal to 1 vertical.

(2) A line drawn from the outside edge of the top of the concrete lining extended downward and away from the canal at a slope of 1 horizontal to 1 vertical.

d. To contain the slurry during installation, jacking pits should be constructed so that natural ground or a compacted dike is entirely around the pit to an elevation at least 1 foot above the top of the canal lining.

e. All excavations should be in compliance with Occupation Safety and Health Administration regulations and Reclamation's Health and Safety Standards.

f. If the contractor elects to install shoring in the jacking pits, all shoring designs should be prepared by a Professional Engineer knowledgeable in said type of work. A copy of the shoring designs should be submitted to Reclamation.

8. Jacking pits should be backfilled with native material and mechanically compacted to 95 percent of the maximum dry density per ASTM D-698.

9. The contractors should be responsible for any damage to the canal section during the construction of a crossing, and the contractor shall repair the damage at their own expense.

10. If an emergency situation develops during construction, the contractor should immediately notify appropriate contacts with Reclamation. Reclamation must approve further work at that point.

11. The minimum distance between two jacked pipes should be 10 feet.

12. Any pressure lines installed within Reclamation's ROW must have adequate thrust restraint at bends and valves. Specified design pressures and thrust restraint calculations shall be provided to Reclamation to confirm the design configuration.

Appendix B

Guidelines – Removal of Trees and Other Vegetative Growth from Earth Dams, Dikes, and Conveyance Features

Excerpted from: Review of Operation and Maintenance Program Field Examination Guidelines

APPENDIX B

GUIDELINES
REMOVAL OF TREES AND OTHER VEGETATIVE GROWTH FROM EARTH DAMS, DIKES, AND CONVEYANCE FEATURES*

Growth of trees and other significant vegetation on or adjacent to earth dams, dikes, and conveyance features, should be prevented from becoming established for the following reasons:

1. To allow proper surveillance and inspection of the structures and adjacent areas for seepage, cracking, sinkholes, settlement, deflection, and other signs of distress.
2. To allow adequate access for normal and emergency Operation and Maintenance (O&M) activities.
3. To prevent damage to the structures due to root growth, such as shortened seepage paths through embankments; voids in embankments from decayed roots or toppled trees; expansion of cracks or joints of concrete walls, canal lining, or pipes; and plugging of perforated or open-jointed drainage pipes.
4. To discourage animal/rodent activity (by eliminating their food source and habitat), thereby preventing voids within embankments and possible shortened seepage paths.
5. To allow adequate flow-carrying capability of water conveyance channels (e.g., spillway inlet and outlet channels; open canals, laterals, and drains).

The growth of trees and potentially detrimental vegetation should be prevented during its early stages as part of the operating office or entity's normal O&M program. Early control is generally the most cost effective means of avoiding potential adverse effects on these structures from their continued growth. Control efforts may consist of applying herbicides, spraying, cutting, and/or removing the trees or undesirable vegetation.

Suggested clearance zones (areas of control) adjacent to these structures are provided within these guidelines. Concerted efforts should be made to maintain these clearance zones. However, site-specific conditions, such as landscaping, accessibility, erosion susceptibility of material in the area, type of abutment material, original construction clearance zone, right-of-way easement, etc., may influence the necessity or success of these control efforts.

Should trees and/or other significant vegetation become established, proper O&M of earth embankment dams, dikes, and conveyance features, may require their discriminate removal. During the Review of Operation and Maintenance examination for the facility or system, the examiners should use these guidelines, along with their experience and professional judgment, to evaluate the need for removal of such established growth.

If trees and other significant growth are identified by the examination team in locations delineated by these guidelines, a determination should be made regarding their need for removal. If the identified vegetation is deemed to be in location such that its existence is not considered to be detrimental and therefore does not require removal, sufficient justification should be provided during the examination and included within the associated report to support that determination.

---

* Enclosure to memorandum dated April 26, 1989, from Manager, Project Operation Services Staff, to all Regional Directors, Subject: Revised Guidelines — *Removal of Trees and Other Vegetative Growth From Earth Dams, Dikes, and Conveyance Features.*

When, in the opinion of an Review of Operation and Maintenance examination team, such established growth requires removal, specific followup procedures should be addressed as part of the examination. Such procedures may include the need for right-of-way easement determination; the need for an assessment for potential environmental impacts (any impact assessments should be coordinated with designated regional or project office environmental staff); whether removal of the root system is necessary and to what extent; the method of removal and recompaction of material within the void created; and the need for any erosion stabilization measures.

National Environmental Policy Act compliance is required relative to such tree and vegetation removal. Additionally, the application of herbicides should comply with applicable provisions of the Endangered Species Act. The determination of appropriate procedures to be followed in assessing potential environmental impacts and mitigation (including those to wildlife and its habitat) will be the responsibility of each regional and/or project office. This will include the preparation of an appropriate National Environmental Policy Act document and an assessment of the need for mitigation prior to the onset of removal activities. Appropriate National Environmental Policy Act compliance may include a Categorical Exclusion Checklist, an environmental assessment followed by a Finding of No Significant Impact, or an Environmental Impact Statement.

The following guidelines and associated clearance zones should be used for all Reclamation earth dams, dikes, and conveyance features. They are not considered "policy;" rather, they are guides which should be used with reasonable judgment and practicality.

1. Trees and detrimental vegetative growth should be prevented from becoming established on the surface of all earth dam, dike, and conveyance feature embankments. A small amount of shallow-rooted vegetation may be acceptable to aid in erosion protection and slope stabilization. Mowing of grass and other small vegetation is desirable and may be necessary to allow proper surveillance of the surfaces and observation of animal/rodent activity.

2. A clearance zone of 25 feet beyond each contact (groins and toe) of earth dam embankments and dikes should be maintained of all trees and detrimental vegetation. Similarly, a clearance zone of 15 feet should be maintained beyond the outside toe of all fill sections/embankments for open canals and laterals. These clearance zones may need to be extended for seepage areas or other conditions where proper surveillance or access may be warranted.

3. Earth dam, dike, and conveyance feature (open canal and lateral) embankments have large tree growth or stumps from previously cut trees on or near them should be evaluated, usually in conjunction with an Review of Operation and Maintenance examination, for any necessary future action, (i.e., monitor, excavation and backfill, rebuild, etc.). Generally, sizable old root systems of large trees should be grubbed out and the embankment replaced and compacted to prevent the development of piping action or erosion. Likewise, any sizable voids resulting from animal/rodent burrowing activity should be filled and compacted. Seeding may be necessary for protection from surface erosion.

4. Spillway inlet and outlet channels, outlet works discharge channels, and other open conveyance channels (open canals, laterals, and drains) should be free of vegetative growth that could significantly impede water flow or reduce design capacity.

5. A clearance zone of 25 feet adjacent to all concrete structures associated with such facilities should be maintained of all trees and detrimental vegetative growth to prevent damage from root growth, to allow proper surveillance, and to allow adequate O&M access.

6. Associated cut slopes adjacent to open canals and laterals should be kept clear of vegetation which, if toppled and/or uprooted, could affect operations or O&M access.

7. For pipe conveyance systems (such as siphons, aqueducts, discharge lines, perforated or open-jointed drains, etc.), to provide O&M access and to prevent root encroachment, a clearance zone should be maintained 15 feet from each side of the pipeline. However, in some cases, farming of annual crops over pipelines may be permissible.

Description of Geotechnical Data

August 2, 2016

The data described herein are the results of geotechnical investigations performed for the proposed "4 Interchanges on Bangerter Hwy" project. A primary objective of these investigations was to obtain geotechnical data for Design-Build teams to consider in proposal preparation and design. This introduction provides details relative to the geotechnical testing and sampling procedures used in the investigations.

I. SUBSURFACE DRILLING, TESTING, AND SAMPLING

Preliminary geotechnical subsurface investigations were conducted for five general areas along the existing Bangerter Highway (SR-154) corridor, including four proposed interchange locations at 11400 South, 9000 South, 7000 South, and 5400 South, and in an existing drainage pond area near 11800 South. The approximate locations of geotechnical borings completed at each of the locations are shown on Figures 1 through 5. Sampling was generally conducted at depth intervals of 3 feet in the upper 15 to 30 feet of the borings, and at 5-foot depth intervals thereafter.

At each of the proposed interchange locations, borings intended primarily to investigate bridge structure foundation conditions were drilled near three of the four corners of the anticipated bridge footprint area. These bridge borings are numbered with the prefix "16-S" to indicate the year of the drilling (20<u>16</u>) and the primary purpose of the boring (foundation investigations for (<u>S</u>tructures). Two to four additional borings were drilled in each interchange area to investigate roadway <u>E</u>mbankment and/or <u>E</u>xcavation subsurface conditions, and these borings are numbered with the prefix "16-E". The borings drilled in the existing <u>D</u>rainage pond area near 11800 South are numbered with the prefix 16-D.

The geotechnical borings were performed using a CME-55 rotary drill rig mounted on a two-ton truck and a CME-850 drill rig on a rubber-tired ATV. Borings were advanced with the CME-55 using NW drill rods and tri-cone rock bits. NW or HWT casing was used with water as the drilling fluid to maintain an open hole in shallow soils. At greater depths, polymer and/or bentonite drilling mud products were used to maintain an open hole below the casing. The borings drilled with the CME-850 were advanced using HQ drill rod and a 3-7/8" open-face bit the full depth of the exploration. Sampling in all cases was performed using NW drill rods lowered through the NW or HWT casing or the HQ drill rod.

Disturbed samples were obtained by driving a standard 2-inch O.D. split spoon sampling tube through a distance of 18 inches using a 140-pound weight dropped from a distance of 30 inches. In some cases, a 2.5-inch or 3-inch O.D. sampling spoon was used. The sampler size is indicated on the boring logs. The sampling tubes used were internally dimensioned to accommodate liners; however, no liners were used.

Based on energy evaluations conducted approximately annually in general accordance with ASTM D 4633, the automatic trip hammer used for sampling with the CME-55 has an average tested energy equal to about 79 percent of the theoretical maximum energy, and the automatic hammer on the CME-850 has an average tested energy equal to about 80 percent of the theoretical maximum energy.

The number of hammer blows required to drive the sampling spoon through each 6 inches of penetration is shown on the boring logs. These 6-inch blow counts are uncorrected. The sum of the last two blow counts, which represents the number of blows recorded while driving the sampling spoon through 12 inches, is defined as the standard penetration value, *N*.

Standard penetration values corrected for sampler size, overburden, and hammer energy provide a good indication of the in-place density of sandy soils; however, they only provide an indication of the relative stiffness of cohesive material, since the penetration resistance of materials of this type is a function of moisture content.

Considerable care must be exercised in interpreting the standard penetration value in gravelly-type soils, particularly where the size of the granular particle(s) exceeds the inside diameter of the sampling spoon. If the spoon can be driven through the full 18 inches with reasonable sample recovery, the standard penetration value generally provides a good indication of the in-place density of gravelly-type material.

At some locations, it was not possible to drive the sampling spoon through the full 18 inches without excessive blow counts. In these instances, the number of blows and resulting penetration are noted on the boring logs.

Corrections applied to the raw field blow counts to determine the corrected standard penetration $(N_1)_{60}$ values shown on the boring logs were as follows:

- Sampler size correction for 2.5-inch OD sampler or 3.0-inch OD sampler (where applicable) = 0.938 and 0.767, respectively
- Hammer energy correction from 79% (CME-55) or 80% (CME-850) average measured hammer energy ratio to 60% standard energy ratio = 1.32 and 1.33, respectively
- Correction for sampler with internal dimensions to accommodate liners but used without liners: No correction was applied for the purposes of calculating the $(N_1)_{60}$ values shown on the boring logs in this data report
- Overburden correction $C_N = (P_a / \sigma'_{vc})^{0.5} \leq 1.7$
  where: P_a = atmospheric pressure = approximated as 2000 psf,
  σ'_{vc} = effective vertical stress calculated using an assumed average total soil unit weight of 115 pcf and hydrostatic pore pressure calculated from the measured or estimated static groundwater level.

Relatively undisturbed samples were obtained from the borings by pushing thin-walled (Shelby) sampling tubes with sharpened cutting edges into the subsurface material, using the hydraulic pressure on the drill rig. Where NW casing was used, the tubes had a nominal outside diameter of 2.75 inches and nominal wall thickness of 0.06 inch. Where HWT or HQ were used, the tubes had a nominal outside diameter of 3.00 inches and a nominal wall thickness of 0.065 inch. The depths at which Shelby tube samples were attempted are identified on the boring logs.

Miniature vane shear tests, which may provide an approximate indication of the undrained shearing strength of cohesive materials, were performed on most samples of cohesive soils during the field investigations. The results of these tests are shown on the boring logs as "torvane" values in units of tons per square foot. Pocket penetrometer tests, which may provide an approximate indication of the unconfined compressive strength of cohesive soil, were also performed on selected samples.

Relative stiffness and density descriptors noted on the boring logs were determined from the field and lab data in general accordance with the UDOT Geotechnical Manual of Instruction. In describing the stiffness of cohesive soils, preference was typically given to UU triaxial

compression test results prior to torvane and pocket penetrometer results, and to torvane and pocket penetrometer results prior to blow counts.

Each sample obtained in the field was classified in the laboratory according to the Unified Soil Classification System. The symbols designating soil types according to this system are presented on the boring logs. A description of the Unified Soil Classification System is included in the Appendix, and the meanings of the various symbols shown on the logs can be obtained from this figure. Laboratory-tested samples were also classified according to the AASHTO Classification System, and the symbols designating the soil types according to this system are noted on the boring logs.

II. LABORATORY TESTING PROCEDURES

Laboratory tests performed during this investigation to define the characteristics of the subsurface material included the following:

1) Moisture Content
2) Sieve Analysis
3) Atterberg Limits
4) Soil Density
5) One-Dimensional Consolidation
6) Direct Shear
7) Unconsolidated-Undrained (UU) Triaxial Compression
8) Consolidated-Undrained (CU) Triaxial Compression w/ pore pressure measurements
9) Electro-chemical Tests (pH, Resistivity, Sulfate, and Chloride)

Consolidation tests were performed on specimens measuring approximately one inch thick and 2.37 inches in diameter, with drainage allowed at both top and bottom during testing. The results of these tests are plotted in the Appendix in terms of both strain and void ratio versus pressure. The specific gravity of the samples was assumed to equal 2.7 in estimating void ratios.

As noted on the plots of the consolidation test results, most of the test samples were inundated with water either throughout the test or after a load of 0.25 tsf had been applied. In some cases, a comparison specimen from the same Shelby tube sample was tested without adding water, with the sample, ring, and porous stones enclosed in a loose-fitting sealed plastic bag to prevent loss of sample moisture to evaporation.

Laboratory testing was performed in accordance with applicable standards published by the ASTM International and/or the American Association of State Highway and Transportation Officials (AASHTO). Variations from the standards, if any, are noted on the test data plots.

IV. LIMITATIONS

The information presented herein is based upon the results of field and laboratory tests. It should be recognized that soil materials are inherently heterogeneous and that conditions may exist throughout the site which were not defined during these investigations. Water levels noted on the test hole logs represent the depths to water measured at the time of the investigation. Groundwater levels and soil moisture conditions will vary with time and location.

The number and depths of the subsurface investigations presented herein are limited, and are not intended to provide a sufficient basis for complete geotechnical design of the Project. It is anticipated that supplemental investigations will be conducted for final design.

It is not the intent of this data report to provide any geotechnical analyses nor recommendations related to the project, and interpretations have been limited to those necessary to draw the boring logs. The Design-Builder is responsible for conducting geotechnical investigations, analysis, and design to complete the project, and for interpretations of all data used.

The information accompanying this document is provided for the specific location and purpose of the “4 Interchanges on Bangerter Hwy” project, and is not intended or considered suitable for any other use. Any such unauthorized use by any other party is at that party's sole risk, and the Department does not accept any liability or responsibility for its use.

Unified Soil Classification System

Major Divisions			Group Symbols		Typical Names	Laboratory Classification Criteria		
COARSE-GRAINED SOILS *more than half of material is larger than No. 200 sieve*	Gravels *more than half of coarse fraction is larger than No. 4 sieve size*	Clean Gravels *little or no fines*	GW		Well graded gravels, gravel-sand mixtures, little or no fines	*For laboratory classification of coarse-grained soils* Determine percentage of gravel and sand from grain-size curve. Depending on percentage of fines (*fraction smaller than No. 200 sieve size*), coarse-grained soils are classified as follows: **Less than 5%** GW, GP, SW, SP **More than 12%** GM, GC, SM, SC **5% to 12%** Borderline cases requiring use of dual symbols**	$C_u = \frac{D_{60}}{D_{10}}$ Greater than 4 $C_c = \frac{(D_{30})^2}{D_{10} \times D_{60}}$ Between 1 and 3	
			GP		Poorly graded gravels, gravel-sand mixtures, little or no fines		Not meeting all gradation requirements for GW	
		Gravels With Fines *appreciable amount of fines*	GM*	d	Silty gravels, poorly graded gravel-sand-silt mixtures		Atterberg limits below "A" line, or PI less than 4	Above "A" line with PI between 4 and 7 are borderline cases requiring uses of dual symbols
				u				
			GC		Clayey gravels, poorly graded gravel-sand-clay mixtures		Atterberg limits above "A" line, or PI greater	
	Sands *more than half of coarse fraction is smaller than No. 4 sieve size*	Clean Sands *little or no fines*	SW		Well graded sands, gravelly sands, little or no fines		$C_u = \frac{D_{60}}{D_{10}}$ Greater than 6 $C_c = \frac{(D_{30})^2}{D_{10} \times D_{60}}$ Between 1 and 3	
			SP		Poorly graded sands, gravelly sands, little or no fines		Not meeting all gradation requirements for SW	
		Sands with Fines *appreciable amount of fines*	SM*	d	Silty sands, poorly graded sand-silt mixtures		Atterberg limits below "A" line, or PI less than 4	Above "A" line with PI between 4 and 7 are borderline cases requiring uses of dual symbols
				u				
			SC		Clayey sands, poorly graded sand-clay mixtures		Atterberg limits above "A" line, or PI greater	
FINE-GRAINED SOILS *more than half of material is smaller than No. 200 sieve*	Silts and Clays *liquid limit is less than 50*		ML		Inorganic silts and very fine sands, rock flour, silty or clayey fine sands or clayey silts with slight plasticity	*For laboratory classification of fine-grained soils*  Plasticity Chart		
			CL		Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays			
			OL		Organic silts and organic silt-clays of low plasticity			
	Silts and Clays *liquid limit is greater than 50*		MH		Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts			
			CH		Inorganic clays of high plasticity, fat clays			
			OH		Organic clays of medium to high plasticity, organic silts			
HIGHLY ORGANIC SOILS			Pt		Peat and other highly organic soils			

*Division of GM and SM groups into subdivisions of d and u for roads and airfields only. Subdivision is based on Atterberg limits; suffix d used when liquid limit is 28 or less and the PI is 6 or less, the suffix u used when liquid limit is greater than 28.

***Borderline classification*: Soils possessing characteristics of two groups are designated by combinations of group symbols. (For example GW-GC, well graded gravel-sand mixture with clay biner.)

PCBs	polychlorinated biphenyls
REC	recognized environmental condition
UDEQ	Utah Department of Environmental Quality
UDOT	Utah Department of Transportation
USC	U.S. Code
UST	underground storage tank

Note: A more complete acronym list is located in the Governmental Database Report, Appendix A.

Executive Summary

In June 2016, HDR, Inc. (HDR) conducted a Phase I Environmental Site Assessment (ESA) of properties at the Bangerter Highway and W 9000S Street intersection (Subject Property) at the request of the Utah Department of Transportation (UDOT). The Subject Property includes several landowners.

HDR conducted this ESA in conformance with the scope and limitations of the American Society for Testing and Materials (ASTM) Practice E 1527-13; the ESA satisfies the requirements of Title 40 of the Code of Federal Regulations (CFR) Part 312 (40 CFR 312). Data gap analysis is presented in Section 5 of this ESA. This Phase I ESA summarizes the site reconnaissance conducted on June 30, 2016; reviews environmental database findings; reviews historical data source findings; and summarizes a telephone interview conducted with Doug Bacon of the Utah Department of Environmental Quality (UDEQ).

The Subject Property includes a portion of Bingham Creek, which was part of response actions implemented at the Kennecott South Zone Superfund Site near Copperton, Utah. Response actions in the 1990s, within and adjacent to the Subject Property, included three phases of soil removal activities from the Bingham Creek channel and its banks along residential areas to address lead and arsenic contaminated soils. Contaminated sediments were also removed from Bingham Creek in 1992 during construction of the Jordan Valley Hospital. A Phase II site investigation will be necessary to assess the concentrations of constituents of concern (COCs), arsenic and lead, in the soil along Bingham Creek.

Figure 1 is an area map showing the relative location of the Subject Property. **Figure 2** is a site map of the Subject Property and adjoining land. Photographs of the Subject Property and surrounding properties are presented in Appendix E.

Findings

The following findings have been made on the Subject Property:

- The Subject Property is located along existing four-lane roads and the adjoining properties, which include a residential subdivision and a fallow field. Salt Lake Community College and Jordan Valley Hospital are also located adjacent to the Subject Property.
- Land uses within the immediate area of the Subject Property is urban, including residential subdivisions, a community college, a hospital, small industrial facilities, retail, and small agricultural parcels.
- EDR searched environmental information databases for the Subject Property on June 24, 2016. They searched federal, state, local, tribal, and EDR-proprietary databases as defined by ASTM E 1527-13. The search revealed one National Pollutant Discharge Elimination System (NPDES) permit for stormwater at the Jordan Valley Hospital. The other mapped sites included on the EDR Radius Map Report are in excess of 0.25 miles of the Subject Property.

- The Subject Property includes a portion of Bingham Creek, which was part of response actions implemented at the Kennecott South Zone Superfund Site near Copperton, Utah. Response actions in the 1990s, within and adjacent to the Subject Property, included three phases of soil removal activities from the Bingham Creek channel and its banks along residential areas to address lead and arsenic contaminated soils. Contaminated sediments were also removed from Bingham Creek in 1992 during construction of the Jordan Valley Hospital. Bingham Creek flows through a box culvert under the Subject Property from the Vista West Subdivision towards the Jordan Valley Hospital (northeasterly direction). UDEQ and EPA Region 8 have compiled soil action levels for Bingham Creek. Therefore, a Phase II site investigation will be necessary to assess the concentrations of constituents of concern (COCs), arsenic and lead, in the soil along Bingham Creek.
- During the reconnaissance visit, HDR observed transmission lines (no transformers) along the north side of W 9000 S and along the east side of the Salt Lake Community College campus. HDR did not observe any hazardous materials on the Subject Property. The only debris was trash (bottles, aluminum cans, fast food wrappers, etc.) along the Bangerter Highway (see photographs in Appendix E).

Opinions

HDR concludes that the historically contaminated soils along Bingham Creek are a “recognized environmental condition” (REC) within the Subject Property, as enumerated in the Findings section above. The following statement is required by ASTM E 1527-13 as a declaration of whether RECs were found:

> *HDR has performed a Phase I ESA in conformance with the scope and limitations of ASTM E 1527-13 of multiple Parcels at the intersection of the Bangerter Highway and W 9000 S Street and adjoining properties (Subject Property). Any exceptions to or deletions from these practices are described in this report. This report revealed that the historically contaminated soils along Bingham Creek are a REC in connection with the Subject Property.*

Recommendations

HDR developed recommendations through the investigative procedures described in the Scope of Services, Significant Assumptions, and Limitations sections of this report (see Section 1.3). These findings should be reviewed within the context of the limitations provided in the Limitations section.

HDR makes following recommendations:

- **Recommendation 1**: Conduct a Phase II site investigation to determine concentrations of lead and arsenic in the soil along Bingham Creek, which was part of response actions implemented at the Kennecott South Zone Superfund Site near Copperton, Utah.
- **Recommendation 2** If this report is 6 months old or older when property acquisition

occurs, the City of Boise should reevaluate the recommendations in this report. The applicable ASTM standard (1527-13) requires a reevaluation of site conditions if a Phase I ESA is older than 180 days (6 months).

1 Introduction

In June 2016, HDR, Inc. (HDR) conducted a Phase I Environmental Site Assessment (ESA) along the Bangerter Highway and W 9000 S intersection in West Jordan, Utah 84088 (Subject Property) at the request of the Utah Department of Transportation (UDOT). **Figure 1** is an area map showing the relative location of the Subject Property. The Subject Property includes UDOT-owned right-of-way property and multiple parcels of land along the Bangerter Highway and W 9000 S Street (**Figure 2**).

1.1 Purpose

The purpose of this Phase I ESA is to evaluate the Subject Property for indications of recognized environmental conditions (RECs). The American Society for Testing and Materials (ASTM) Practice E 1527-13 defines the following categories of RECs:

> *REC*: *The presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. De minimis conditions are not recognized environmental conditions (*see definition below*).*

ASTM E 1527-13 defines release as a "release of any hazardous substance or petroleum product." This definition has the same meaning as the definition of "release" in Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) 42 U.S. Code (U.S.C.) § 9601(22)).

> *Historical REC (HREC): A past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls).*
>
> *Controlled REC (CREC): A recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls).*

Additional conditions that are not included under the definitions of a REC, but are defined by ASTM Practice 1527-13, include the following:

De minimis: A condition that generally does not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be de minimis conditions are not recognized environmental conditions nor controlled recognized environmental conditions.

Business Environmental Risk: A risk which can have a material environmental or environmentally-driven impact on the business associated with the current or planned use of a parcel of commercial real estate, not necessarily limited to those environmental issues required to be investigated in this practice.

Consideration of business environmental risk issues may involve addressing one or more non-scope considerations.

1.2 Report Users

UDOT authorized HDR to conduct a Phase I ESA of the Subject Property. HDR prepared this Phase I ESA for UDOT, and only UDOT has the right to rely on the contents of this Phase I ESA without written authorization.

1.3 Scope of Services, Significant Assumptions, and Limitations

The services HDR performed for this project consisted of the following:

- Provide a description of the Subject Property, including current land uses (Section 2.2)
- Provide a general description of the topography, soil, geology, and groundwater flow direction (Section 2.4)
- Review reasonably ascertainable and reviewable regulatory information published by federal, state, local, tribal, health, and/or environmental agencies pertaining to the Subject Property (sections 4.1 and 4.2)
- Review historical data sources for the Subject Property, including aerial photographs, topographic maps, fire insurance maps, city directories, and other readily available development data (Section 4.4)
- Interview persons with knowledge of the development history of the Subject Property (Section 4.6)
- Conduct an area reconnaissance and an environmental review—including a visual review of adjoining properties—with a focus on indications of hazardous substances, petroleum products, polychlorinated biphenyls (PCBs), wells, storage tanks, solid waste disposal pits and sumps, and utilities (Section 4.7)
- Determine data gaps in the information obtained and comment on their significance in identifying RECs for the Subject Property (Section 5)
- Prepare a written report of methods, findings, opinions, and conclusions (Section 6)

The goal of this scope of services is to help identify conditions on the Subject Property that may indicate risks regarding hazardous materials storage, disposal, or other impacts. The resulting report may qualify the user for relief from liabilities as one of three "defenses" identified in the 2002 Brownfields Amendments to CERCLA Section 9607 (All Appropriate Inquiry subsections). These three defenses include the following:

1. The "innocent landowner" defense to potential liabilities under 42 U.S.C. § 9601
2. The "contiguous project corridor owner" defense pursuant to 42 U.S.C. § 9607q
3. The "bona fide prospective purchaser" defense pursuant to 42 U.S.C. §9607r

Federal regulations (42 U.S.C §9601(35)(A) and (B),§9607(b)(3), §9607(q); and §9607(r)), promulgated by the U.S. Environmental Protection Agency (EPA), require that liability release be based (in part) on completing all appropriate inquiries (AAI) prior to purchasing a property. Those inquiries are documented by Phase I reports, or ESAs. EPA has agreed that the recently-developed ASTM guidance (ASTM Practice E 1527-13: 3.2.6) specifies and interprets AAI requirements.

A user is defined by ASTM Practice E 1527-13 as the party seeking to use Practice E 1527 to complete an ESA of the Subject Property, and may include a potential purchaser of land in the project area, a potential tenant of the Subject Property, an owner of land in the project area, a lender, or a project area manager. Investigative areas not included in the standard ASTM ESA scope include asbestos, lead-based paint, lead in drinking water, radon or urea formaldehyde, wetland issues, regulatory compliance, cultural and historic resources, industrial hygiene, health and safety, ecological resources, endangered species, and high voltage power lines.

Indoor air quality from sources such as mold and asbestos is not included in the ASTM standard except to the extent that indoor air impacts are caused by releases of hazardous substances into subsurface soil or groundwater (vapor intrusion).

The potential for vapor encroachment or intrusion into structures in the Subject Property are considered and identified from on-site or off-site sources based on the experience of the environmental professional.

The scope of services for ESA projects also does not include completing soil borings, installing groundwater monitoring wells, or collecting soil or groundwater samples. State and national policies and standards relevant to vapor intrusion are in flux and subject to change.

HDR has made the following assumptions in preparing the scope of this assessment:

- Data gathered from public information sources (i.e., libraries or public regulatory agencies) are accurate and reliable.
- Site operations reflect site conditions relative to potential releases and no intentional concealment of environmental conditions or releases has occurred.
- Interview information is directly reported as gathered by the assessor and is limited by the accuracy of the interviewee's recollection and experience.

- Published geologic information and site observations made by the environmental professional are used to estimate likely contaminant migration pathways in the subsurface. These estimates by the environmental professional are limited in accuracy and are generally cross-referenced with existing information about similar sites and environmental releases in the area.
- Regulatory information is limited to sites identified after the late 1980s because reliable records were not kept by regulatory agencies prior to that time frame.

The findings and conclusions presented in this report are based on the procedures described in ASTM Practice E 1527-13, informal discussions with various agencies, a review of the available literature cited in this report, conditions noted at the time of this Phase I ESA, and HDR's interpretation of the information obtained as part of this Phase I ESA. The findings and conclusions are limited to the specific project and properties described in this report, and by the accuracy and completeness of the information provided by others.

An ESA cannot entirely eliminate uncertainty regarding the potential for RECs. Conducting this assessment is intended to reduce, but not eliminate, uncertainty regarding the potential for RECs in connection with the Subject Property within reasonable limits of time and cost. In conducting its services, HDR used a degree of care and skill ordinarily exercised under similar circumstances by reputable members of its profession practicing in the same locality. This Phase I ESA conforms to the level of documentation required in ASTM Practice E 1527-13. HDR may omit discussion of certain records (i.e., sources deemed, in HDR's professional opinion, to be inapplicable or of limited value to the specific needs of this client) in accordance with ASTM; however, if the lack of available documentation results in a data gap, this data gap is identified and its significance is discussed.

2 Site Description

2.1 Location and Legal Description

The Subject Property is comprised of UDOT-owned right-of-way property along the Bangerter Highway and W 9000 S intersection and multiple adjoining parcels (private property and City owned property) in West Jordan, Utah, 84088. The various portions of the Subject Property are located in Section 5 of Township 03 South, Range 01 West in Salt Lake County (**Figure 2**).

2.2 Site and Vicinity Characteristics

The Subject Property is comprised of single-family residential lots and one residual lot, owned by the City of West Jordan, which consists of Bingham Creek and its banks (Figure 2 includes parcels). The Subject Property also includes UDOT right-of-way along the east and west side of Bangerter Highway and the north and south side of W 9000 S Street. Primary access to the Subject Property is the Bangerter Highway or W 9000 S Street. The residential lots (Vista West subdivision) in the southwest corner of the intersection of Bangerter and W 9000 S can be accessed by heading south from W 9000 S on Winthrope Drive. The Subject Property is located within a mixed residential and commercial area, which includes the Jordan Valley Hospital northwest of the intersection, the Salt Lake Community College campus in the southeast corner of the intersection, and a currently fallow pasture on the northwest corner of the intersection.

2.3 Description of Structures, Roads, and Other Site Improvements

The Subject Property is developed except the fallow pasture located on the northwest corner of the intersection of the Bangerter Highway and W 9000 S Street. Development includes residential subdivisions, athletic fields and parking lots associated with the Salt Lake Community College Jordan Campus, and medical facilities and parking lots associated with the Jordan Valley Medical Center.

2.4 Area Geology and Hydrogeology

West Jordan, Utah, is located between the Jordan River and the Oquirrh Mountains within the Jordan River Basin. The Subject Property is located within the historic floodplain of Bingham Creek, which consists of Post-Lake Bonneville (Holocene) alluvial deposits ranging from silty, fine- to coarse-grained sand, and pebbles and cobbles. The area to the north and south of the historic floodplain along Bingham Creek consists of Bonneville Lake Cycle (late Pleistocene) fine-grained lacustrine deposits. The area to the west consists of late Pleistocene gravel of lacustrian and/or alluvial origin.

Depth to groundwater varies near the Subject Property; however, in general, it is at least 80 feet below land surface. The groundwater gradient is towards the Jordan River to the east (Stolp 2007).

Based on the Natural Resource Conservation Service (NRCS) Soil Survey for Salt Lake County, the dominant soils in the area is characterized in Table 1.

Table 1. Dominant Soils at Subject Property

Soil Component Name (surface texture)	Red Rock Silt Loam
Characteristics	The Red Rock Silt Loam occurs along the historic floodplain of Bingham Creek, with a typical profile of silt loam from 0-4 inches, silty clay loam from 4-28 inches, clay loam from 28-40 inches, silt loam from 40 to 45 inches, and silty clay loam from 45 to 60 inches. The parent material is alluvium.
Soil drainage class	Well drained. Moderately low to moderately high transmissivity (0.06 to 0.20 inches per hour). The available water storage is high.
Depth to bedrock	More than 80 inches
Soil Component Name (surface texture)	Bingham Gravelly Loam
Characteristics	The Bingham Gravelly Loam occurs to the south of the historic floodplain of Bingham Creek, with a typical profile of gravelly loam from 0-6 inches, gravelly sandy clay loam from 6-12 inches, gravelly fine sand loam from 12-18 inches, very gravelly sand loam from 18 to 27 inches, and extremely gravelly sand from 27 to 60 inches. The parent material is fine-loamy slope alluvium derived from quartzite and/or limestone over sandy and gravelly lacustrine deposits derived from quartzite and/or limestone.
Soil drainage class	Well drained. Moderately high to high transmissivity (0.60 to 2.00 inches per hour). The available water storage is very low.
Depth to bedrock	More than 80 inches
Soil Component Name (surface texture)	Butterfield Soils
Characteristics	The Butterfield soils occur to the north of the historic floodplain of Bingham Creek, with a typical profile of gravelly silt loam from 0-5 inches, very gravelly silt loam from 5-10 inches, extremely gravelly loam from 10-22 inches, very gravelly loam from 22 to 50 inches, and unweathered bedrock from 50 to 60 inches. The parent material is colluvium and/or residuum.
Soil drainage class	Well drained. Very low to moderately high transmissivity (0.00 to 0.20 inches per hour). The available water storage is very low.
Depth to bedrock	50 inches

3 User-Provided Information

UDOT, as the user of this ESA, is aware that the Subject Property includes a portion of Bingham Creek, which was part of response actions implemented at the Kennecott South Zone Superfund Site near Copperton in Salt Lake County, Utah. UDOT has indicated that a Phase 2 ESA will be necessary for the project in the area of Bingham Creek in order to assess potential exposure to workers and also to determine management of excavated soils.

4 Records Review

4.1 Environmental Records Review

HDR contracted Environmental Data Resources, Inc. (EDR) to complete a database search of federal, state, and tribal environmental records for the area around the Subject Property.

EDR searched environmental information databases for the Subject Property on June 24, 2016. They searched federal, state, local, tribal, and EDR-proprietary databases as defined by ASTM E 1527-13. The database search yielded no results. A complete copy of the EDR environmental database report is included in Appendix A.

4.1.1 Utah LUST Database

The LUST database search indicated the following closed, leaking underground storage tank (LUST) site is within 0.5 miles of the Subject Property:

- Salt Lake Community College Jordan Campus
  9100 S 3400 W West Jordan, UT 84088
  Southeast and adjacent to Subject Property
  Notification Date: 06/05/2003
  Closed Date: 08/25/2015

4.1.2 UST Database

The UST database search indicated the following underground storage tanks (UST) are within 0.25 miles of the Subject Property.

- Jordan Valley Hospital
  3580 W 9000 S West Jordan, UT 84088
  Northeast and adjacent to Subject Property
  Total Tanks: 2
  Closed Tanks: 1
- Wasatch Cabinet and Furniture Company
  3412 W 8600 S West Jordan, UT 84088
  Northeast of Subject Property
  Total Tanks: 1
  Closed Tanks: 1

4.1.3 INST CONTROL Database

The INST CONTROL database search, which includes remediation sites that have institutional controls restricting use, identified no property within a 0.5-mile search radius.

While this database did not identify properties in the search radius, the Subject Property includes a portion of Bingham Creek, which was part of the Kennecott South Zone Superfund Site and restrictions on land use and construction activities have been implemented (described in Section 4.4 and 4.5).

4.1.4 BROWNFIELDS and US BROWNFIELDS

Idaho and EPA both maintain Brownfields databases. Searches of these databases did not identify any sites within the 0.5-mile search radius.

4.1.5 NPDES

The National Pollutant Discharge Elimination System (NPDES), which is the permit system mandated by § 402 of the Clean Water Act to control pollutants in waters of the U.S., including storm water. The Jordan Valley Cancer Center (part of the Jordan Valley Hospital complex) holds a NPDES for non construction stormwater. The UDEQ permit is UTR371675 and the receiving water body is the Utah Lake Distribution Canal.

4.1.6 EPA CERCLIS

CERCLIS Search, which retrieves Superfund data from the Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) database in Envirofacts, identified no sites within a 0.5-mile search radius. The EDR report did not include information about Bingham Creek, which was part of response actions implemented at the Kennecott South Zone Superfund Site near Copperton, Utah. A portion of Bingham Creek is located within the Subject Property. See sections 4.4 and 4.5 for additional information.

4.2 Additional Regulatory Information

On July 5, 2016, Doug Bacon, Environmental Scientist at the Utah Department of Environmental Quality (UDEQ), Division of Environmental Response and Remediation, provided HDR with a brief history of Bingham Creek, which was part of response actions implemented at the Kennecott South Zone Superfund Site near Copperton, Utah.

From approximately 1904 until 1932, multiple companies mined and milled lead and/or copper ores in Bingham Canyon. The residual tailings material from the milling operation, which contained lead and arsenic, was disposed of in waste piles near the mills or directly into Bingham Creek. Runoff and flooding transported the tailings down Bingham Creek and deposited them along the banks of the channel. During construction activities at the Jordan Valley Hospital in 1992 Kennecott and its contractors excavated the tailings in Bingham Creek and its banks on hospital property and transported them off-site. Between 1991 and 1997 Kennecott and Arco complete three Phases of sediment removal in Bingham Creek along residential areas.

Bingham Creek flows through a box culvert under the Subject Property from the Vista West Subdivision towards the Jordan Valley Hospital. Earthwork along Bingham Creek is subject to action levels for arsenic and lead. Mr. Bacon provided HDR with a December 2015 UDEQ guidance memorandum regarding soil and groundwater action levels specific to this portion of Bingham Creek within the Subject Property. Appendix F contains documents regarding response actions along Bingham Creek as part of the Kennecott South Zone Superfund Site.

4.3 Historical Use Information

The objective of reviewing historical use information is to develop a history of previous land uses at, and in the vicinity of, the Subject Property, and to assess these uses for potential hazardous materials impacts that may affect the Subject Property. HDR reviewed those

historical sources that were reasonably ascertainable and likely to provide useful information, as defined by the ASTM standard: fire insurance maps, city directory information, historical aerial photographs, and historical topography maps.

4.3.1 Fire Insurance Maps

Private fire insurance companies produce fire insurance maps to indicate uses of the project area on specified dates. HDR requested fire insurance maps from EDR, the copyright holder for the Sanborn map collection. However, no Sanborn fire insurance map coverage exists for the Subject Property.

4.3.2 City Directory Information

Business directories, including city, cross-reference, and telephone directories, are available for the area around the Subject Property. The Subject Property is located in a densely-developed urban area, which corresponds to a high number of recorded addresses. HDR reviewed the city directories provided by EDR, which are presented in Appendix B. The city directories reflect current land use, which is mostly associated with the Jordan Valley Hospital, the Salt Lake Community College, and residential. HDR did not identify city directory information within the Subject Property or adjoining areas that would indicate historic or current industrial uses that could present environmental concerns.

4.3.3 Historical Aerial Photographs

Historical aerial photographs are valuable for the environmental assessor to review features of properties in and near the Subject Property over time. HDR reviewed historical aerial photographs as provided by EDR from 1937 through 2011. HDR discovered no indications of RECs during the historical aerial photograph review. The aerial photographs show that the segment of Bingham Creek near the Subject Property remained in the same main channel since 1937. Descriptions of the photographs are provided in the following paragraphs. Copies of aerial photographs are provided in Appendix C.

- 1937 – The Subject Property appears to be undeveloped and within the floodplain of Bingham Creek. Some of the adjacent parcels to the north and south of the Subject Property are cultivated fields and/or grazing areas. Some dirt paths exist along Bingham Creek. The Utah Lake Distributing Canal just to the east of the Subject Property, the Old Bingham Highway to the north, and the adjacent Denver and Rio Grande Western railroad tracks are visible. The present day location of Wight's Fort Cemetery appears to be already enclosed.
- 1946 – The Subject Property and the surrounding areas appear much as described for the 1937 photograph. Agricultural development continues in the surrounding areas. A small pond is visible just to the northwest of Wight's Fort Cemetery, near the present day Jordan Valley Hospital. W 9000 S appears to be a gravel road that does not cross Bingham Creek.
- 1952 – The Subject Property and the surrounding areas appear much as described for the 1946 photograph. W 9000 S connects across Bingham Creek. The southeast portion

of the parcel that is now occupied by the Jordan Valley hospital contains at least one structure and is further improved for agricultural purposes.

- 1958 – The Subject Property and the surrounding areas appear much as described for the 1952 photograph, with the exception of several small structures located at the southwest corner of the present day Jordan Valley Hospital parcel.
- 1965 – The Subject Property and the surrounding areas appear much as described for the 1958 photograph, with the exception of additional new small structures that are outside of the study area.
- 1971 – The Subject Property and the surrounding areas appear much as described for the 1965 photograph. Residential development continues east of the Subject Property.
- 1977 - The Subject Property and the surrounding areas appear much as described for the 1971 photograph. Residential development continues east of the Subject Property and a new subdivision is visible north of the Old Bingham highway. The small structures located in the southwest corner of the present day Jordan Valley Hospital, first visible in the 1958 photograph, are no longer present.
- 1981 – The Vista West subdivision is under development, including the residences directly west of the present day Bangerter Highway south of W 9000 S along the Bingham Creek floodplain. The parcel located between the present day Jordan Valley Hospital and the Utah Lake Distribution Canal appears to be in the early stages of residential or commercial development, and residential development continues outside of the study area.
- 1993 – The Vista West subdivision has expanded since the 1981 photograph and the Jordan Valley Hospital is now under construction. The nursing home/assisted living facility west of the present day Bangerter Highway, north of W 9000 S, is complete and the subdivision to the north and west of the facility has expanded. Significant earthwork is visible where the overpass of the Old Bingham Highway and the not-yet-present Bangerter Highway is under construction. The water tank just to the south of the Wight's Fort Cemetery is also visible.
- 1997- The Subject Property and the immediate vicinity appears much like in the 1993 photograph, except that the Bangerter Highway is now visible and construction at the hospital is now complete. Bingham Creek is routed underneath the Bangerter highway between the Vista West subdivision and the hospital. The small pond between the hospital and Wight's Fort Cemetery appears to have been removed.
- 2006 - The Subject Property and the immediate vicinity appears much like in the 1993 photograph, except that the campus of Salt Like City Community College campus is now present and the Vista West subdivision expanded just west of the Bangerter Highway. The Jordan Valley Hospital expanded its parking lot in the southwest corner of the parcel. Commercial and residential development in the surrounding area continues.

- 2009 - The Subject Property and the surrounding areas appear much as described for the 2006 photograph, with the exception of the addition of homes within the Vista West subdivision north of Bingham Creek.
- 2011 - The Subject Property and the surrounding areas appear much as described for the 2009 photograph. Commercial and residential development in the surrounding area continues.

4.3.4 Historical Topographic Maps

Historic topographic maps augment information gathered in the historic aerial photograph review (Appendix D). HDR discovered no indications of RECs during the historical topographic review. A summary of the maps follows:

- 1925 and 1928 – No information is contained on these two topographic maps.
- 1951 (1:24000) – The map shows one structure on the Subject Property just north of present day W 9000 S, where Bangerter exists now, and a small pond and a structure on the present day Jordan Valley Hospital parcel just north of W 9000 S. Bingham Creek, Provo Reservoir Canal, Utah Lake Distribution Canal, Denver and Rio Grande Western railroad tracks, the old Bingham Highway, and the Wight's Fort Cemetery are included in the immediate vicinity of the Subject Property.
- 1963 (1:24000) – The Subject Property and the immediate vicinity are mostly unchanged from the 1951 topographic map.
- 1969 (1:24000) – The Subject Property and the immediate vicinity are mostly unchanged from the 1963 topographic map. The map shows some additional structures north of W 9000 S near the present day Jordan Valley Hospital, and additional structures throughout the extent of the topographic map surrounding the Subject Property. Bingham Creek downstream of the present day Jordan Valley Hospital is shown as a ditch.
- 1975 (1:24000) – The Subject Property and the immediate vicinity are mostly unchanged from the 1969 topographic map. The map shows some additional structures north of W 9000 S near the present day Jordan Valley Hospital, and a subdivision north of the Old Bingham Highway. There are additional structures throughout the extent of the topographic map surrounding the Subject Property.
- 1999 (1:24000) – The maps shows Vista West subdivision, the Jordan Valley Hospital, and the Bangerter Highway near the Subject Property. The larger area within the extent of the topographic map shows significant development since the 1975 topographic map.
- 2014 (1:24000) – This map focuses on roads, creeks, ditches, hospitals, and schools, and includes less detail than the 1999 topographic map. The primary, notable addition visible in this map is the Vista West subdivision expansion along the Bangerter Highway and the Salt Lake Community College.

4.4 Environmental Liens, Activity Use Limitations and Additional Information

According to UDEQ and the City of West Jordan, the Subject Property will be required to conduct soil sampling along Bingham Creek prior to commencing earthwork activities. The primary constituents of concern are lead and arsenic. These constituents are associated with historic mining activities near Copperton, located approximately 7 miles west and upstream of the Subject Property. During the early days of mining, wastes from mining and processing activities were discharged directly into the Bingham Creek channel (EPA 2010). UDEQ compiled a guidance memorandum dated December 29, 2015, that outlines the soil and groundwater action levels that would be associated with earthwork along the Bingham Creek floodplain.

4.5 Summary of Previous Environmental Investigations

Bingham Creek and the surrounding historic floodplain, which cross the Subject Property, have been part of a large-scale environmental investigation and remedial action as part of the Kennecott South Zone Superfund Site near Copperton. This portion of Bingham Creek has been characterized for concentrations of lead and arsenic since 1990. Kennecott removed up to 18 inches of contaminated soil from residential areas along Bingham Creek between 1991 and 1997. In 1992 Kennecott removed sediments from Bingham Creek on the Jordan Valley Hospital property. Removal of sediments was based on measured concentrations of lead and arsenic. Contaminated sediments were removed from Bingham Creek channel and its banks. The site chronology, response actions, and technical assessments are described in more detail in the Second Five Year Report Kennecott South Zone (EPA 2010) and the DERR-1996-002882 report attached in Appendix F.

4.6 Interviews

4.6.1 Subject Property Owner

HDR did not conduct interviews with residential property owners in the adjacent subdivisions. HDR did interview city and government personnel about the Subject Property (described below).

4.6.2 City of West Jordan

HDR conducted a telephone interview with Nate Nelson, Engineer with the City of West Jordan. He is familiar with the Subject Property and the issue of contaminated soils along Bingham Creek. Mr. Nelson said that the City of West Jordan does not require a permit or oversight of the sampling activities, but that a Land Disturbance Permit will be required for clean-up related activities if they are necessary. Mr. Nelson confirmed that groundwater levels near the Subject Property are typically at least 80 feet deep.

4.6.3 Utah Department of Environmental Quality

HDR conducted a telephone interview with Doug Bacon, who has had direct involvement as the project manager for UDEQ for the Kennecott South Zone Superfund Site near Copperton in Salt Lake County, Utah. He provided a brief overview of the history of Bingham Creek and the response actions that were completed. In September 1995, UDEQ, EPA, and Kennecott

entered into a memorandum of understanding (MOU). Under this MOU, Kennecott agreed to complete numerous cleanup projects, including the creek area within the Subject Property. Along the Bingham Creek residential areas, removal generally involved removing up to 18 inches of soil from the creek channel and along its banks and replacing it with clean soil. Mr. Bacon referred HDR to the following documents for additional information regarding Bingham Creek in and adjacent to the Subject Property and its history as part of the Kennecott South Zone Superfund Site near Copperton:

- Technical Memorandum, Compilation of soil and groundwater action levels. December 29, 2015
- U.S. Environmental Protection Agency. 2010. Report, Kennecott South Zone. CERCLIS ID: UTD000826404. US EPA Region 8 Denver Colorado 9/29/10
- DERR-1996-002882 (Soil characterization and removal action at Jordan Valley Hospital)

4.7 Site Reconnaissance

Manuel Rauhut of HDR visited the Subject Property on June 30, 2016. He made the following observations during the reconnaissance visit (select photographs taken during the site reconnaissance are provided in Appendix E).

- The Subject Property is located along the Bangerter Highway and W 9000 S Street. The four quadrants on each side of the intersection are developed, but the land use in each quadrant is different (refer to **Figure 2**):
    - Northwest Quadrant:
      The area directly adjacent to Bangerter and W 9000 S is a pasture or hayfield that appears to be no longer irrigated. The area to the north of this field is a residential subdivision and the area to the west includes a residential area and horse pasture. West of that is a nursing home/assisted living facility.
    - Northeast Quadrant:
      The northeast quadrant is occupied by the Jordan Valley Hospital, which includes multiple large buildings surrounded by parking lots. Bingham Creek, which is routed through a box culvert under the intersection from the south west quadrant, daylights approximately 550 feet east of the Bangerter Highway and 130 feet north of W 9000 S. At the time of the site visit, there was water in the creek.
      The area north of the hospital includes a small junk yard or vehicle and boat storage facility, and railroad tracks. North of the railroad tracks is a small topsoil, mulch, sand, and gravel operation.
    - Southeast Quadrant:
      The Salt Lake Community College campus occupies most of the southeast quadrant. A stormwater retention basin is located near the intersection. South of that, along Bangerter Highway, are large and small baseball fields, a parking lot, and some open space. South of the campus are cultivated fields. Along W 9000 S, north of the campus, is a 130-foot diameter water tank and the Wight's Fort

Cemetery. The Utah Lake Distribution Canal is located along the west side of the campus. The Fairchild semiconductor plant to the east of the campus appears to be closed.

- Southwest Quadrant:
  The Vista West subdivision occupies most of the southwest quadrant. Bingham Creek flows through the subdivision. During the site visit, Bingham Creek was dry west of Judd Lane (3720 W), but a little water was flowing to the east. Bingham Creek is routed through a box culvert under Bangerter Highway towards the hospital.

- No hazardous materials were observed by HDR on the Subject Property at the time of the site visit. The only debris was trash (bottles, aluminum cans, fast food wrappers, etc.) along Bangerter.
- No surface staining or other evidence of a hazardous materials release was visually observed by HDR on the Subject Property at the time of the site visit.
- There are transmission lines (no transformers) along the north side of W 9000 S and along the east side of the Salt Lake Community College campus.
- The adjacent property north of the hospital was either a junk yard or a storage facility for boats, and various vehicles. HDR did not enter the facility, but based on observations, there were no obvious spills or storage of hazardous substances.

4.7.1 Known Current and Past Uses of the Site and Adjoining Properties

Subject Property. Based on a review of historical aerial photography, the Subject Property transitioned from mostly agricultural use to urban development, including a college campus, a hospital, and residential subdivisions.

Adjoining Property.

- Northeast – The area to the northeast of the intersection, north of the hospital, consists of mostly small, commercial development and additional subdivisions beyond that.
- Southeast – East of Salt Lake Community College is the Fairchild Semiconductor Plant. This Plant was a Resource Conservation and Recovery Act Large Quantity Generator (RCRA-LQG), but has been closed since 2014. The facility is approximately 0.3 miles to the east and is at a lower elevation than the Subject Property. Beyond the community college and the former Fairchild Semiconductor plant, most of the development consists of residential subdivisions.
- Southwest – The adjoining properties to the southwest are mostly residential subdivisions in addition to schools, churches, and a Wal-Mart.
- Northwest – The adjoining properties to northwest are mostly residential subdivisions.

The layout of the Subject Property and surrounding properties is shown in **Figure 2**. Site photographs are presented in Appendix E.

4.8 Utilities and PCBs

There are transmission lines (no transformers) along the north side of W 9000 S and along the east side of the Salt Lake Community College campus.

5 Data Gap Analysis

The ASTM E 1527-13 standards require a listing of "data gaps," including data failure, encountered during the investigative process that may affect the validity of the conclusions drawn by the environmental professional. The ASTM E 1527-13: 12.7 standard also requires that the environmental professional estimate the relative importance of the data gaps. Generally, gaps in available data are related to the availability of historical data sources for specific sites of concern. The environmental professional uses multiple historical data sources as a method to provide coverage for data gaps. Historical information is collected on a recurring basis, and the passage of time between data sets may or may not constitute a significant gap in data coverage.

- For this project, HDR did not identify any data gaps, as defined by ASTM E 1527-13 that would affect the findings presented in Section 6.0.

6 Findings, Opinions, and Conclusions

In June 2016, HDR conducted a Phase I ESA of properties at the Bangerter Highway and W 9000S Street intersection (Subject Property), which UDOT is evaluating. The Subject Property includes the intersection of the Bangerter Highway and W 9000S Street and several properties adjacent to the Bangerter Highway, north and south of the intersection (Table 1 and **Figure 2**).

HDR performed the ESA in general conformance with the scope and limitations of ASTM Practice E 1527-13. Any exceptions to, or deletions from, this practice are described previously in this report.

6.1 Findings

The following findings have been made on the Subject Property:

- The Subject Property is located along existing four-lane roads and the adjoining properties, which include a residential subdivision and a fallow field. Salt Lake Community College and Jordan Valley Hospital are also located adjacent to the Subject Property.
- Land uses within the immediate area of the Subject Property is urban, including residential subdivisions, a community college, a hospital, small industrial facilities, retail, and small agricultural parcels.
- EDR searched environmental information databases for the Subject Property on June 24, 2016. They searched federal, state, local, tribal, and EDR-proprietary databases as defined by ASTM E 1527-13. The search revealed one National Pollutant Discharge Elimination System (NPDES) permit for stormwater at the Jordan Valley Hospital. The other mapped sites included on the EDR Radius Map Report are in excess of 0.25 miles of the Subject Property.
- The Subject Property includes a portion of Bingham Creek, which was part of response actions implemented at the Kennecott South Zone Superfund Site near Copperton, Utah. Response actions in the 1990s, within and adjacent to the Subject Property, included three phases of soil removal activities from the Bingham Creek channel and its banks along residential areas to address lead and arsenic contaminated soils. Contaminated sediments were also removed from Bingham Creek in 1992 during construction of the Jordan Valley Hospital. Bingham Creek flows through a box culvert under the Subject Property from the Vista West Subdivision towards the Jordan Valley Hospital (northeasterly direction). UDEQ and EPA Region 8 have compiled soil action levels for Bingham Creek. Therefore, a Phase II site investigation will be necessary to assess the concentrations of constituents of concern (COCs), arsenic and lead, in the soil along Bingham Creek.
- During the reconnaissance visit, HDR observed transmission lines (no transformers) along the north side of W 9000 S and along the east side of the Salt Lake Community College campus. HDR did not observe any hazardous materials on the Subject Property.

The only debris was trash (bottles, aluminum cans, fast food wrappers, etc.) along the Bangerter Highway (see photographs in Appendix E).

6.2 Opinions

HDR concludes that the historically contaminated soils along Bingham Creek are a “recognized environmental condition” (REC) within the Subject Property, as enumerated in the Findings section (Section 6.1). The following statement is required by ASTM E 1527-13 as a declaration of whether RECs were found:

> *HDR has performed a Phase I ESA in conformance with the scope and limitations of ASTM E 1527-13 of multiple Parcels at the intersection of the Bangerter Highway and W 9000 S Street and adjoining properties (Subject Property). Any exceptions to or deletions from these practices are described in this report. This report revealed that the historically contaminated soils along Bingham Creek are a REC in connection with the Subject Property.*

7 Recommendations

HDR developed recommendations through the investigative procedures described in the Scope of Services, Significant Assumptions, and Limitations sections of this report (see Section 1.3). These findings should be reviewed within the context of the limitations provided in the Limitations section.

HDR makes following recommendations:

- **Recommendation 1**: Conduct a Phase II site investigation to determine concentrations of lead and arsenic in the soil along Bingham Creek, which was part of response actions implemented at the Kennecott South Zone Superfund Site near Copperton, Utah
- **Recommendation 2** If this report is 6 months old or older when property acquisition occurs, the UDOT should reevaluate the recommendations in this report. The applicable ASTM standard (1527-13) requires a reevaluation of site conditions if a Phase I ESA is older than 180 days (6 months).

8 Qualifications of Environmental Professionals

8.1 Signatures and Qualifications

We declare that, to the best of our professional knowledge and belief, we meet the definition of environmental professional as defined in Section 312.10 of Title 40 of the Code of Federal Regulations (CFR) Part 312.

We have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. We have developed and performed the all appropriate inquires in conformance with standards and practices set forth in 40 CFR Part 312.

Project Manager
Michael R. Murray, PhD

8.1.1 Qualifications of Environmental Professionals

The following HDR personnel performed this Phase I ESA:

Mr. Michael R. Murray, Ph.D., HDR's qualified environmental professional, as defined by ASTM Practice E 1527-13, has 25 years of experience in ESAs, soil and groundwater investigations and remediation, wastewater/biosolids land application, wetland delineation and mitigation, statistical analysis and design, mine site closures, hazardous materials management, biological assessments, database management, research, project management, and teaching. Dr. Murray's responsibilities have included technical lead, project planning, field supervision, schedule and cost control, public relations, and expert witness support. He has conducted over 100 ESAs.

Mr. Manuel B. Rauhut, PE, HDR's qualified environmental professional, as defined by ASTM Practice E 1527-13, has 10 years of experience in ESAs, soil and groundwater investigations, well construction, and wetland delineations and mitigation. Mr Rauhut's responsibilities have included project planning, field supervision, public relations, and expert witness support. He has conducted over 10 ESAs.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS list

SEMS: SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the SEMS list, as provided by EDR, and dated 03/07/2016 has revealed that there is 1 SEMS site within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
WELBY RAILYARD	4200 WEST OLD BINGHA	W 1/8 - 1/4 (0.127 mi.)	27	39

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has

determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 03/07/2016 has revealed that there is 1 SEMS-ARCHIVE site within approximately 0.5 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
WEST JORDAN TOP STOP	2729 WEST 9000 SOUTH	E 1/4 - 1/2 (0.487 mi.)	H33	46

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 12/09/2015 has revealed that there is 1 RCRA-LQG site within approximately 0.25 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
FAIRCHILD SEMICONDUC	***3333 W 9000 S***	***0 - 1/8 (0.000 mi.)***	***13***	***16***

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 12/09/2015 has revealed that there are 2 RCRA-CESQG sites within approximately 0.25 miles of the target property.

State and tribal leaking storage tank lists

UT LUST: The Leaking Underground Storage Tank Incident Reports contain an inventory of reported leaking underground storage tank incidents. The data come from the Department of Environmental Quality's Potential Leaking UST Sites.

A review of the UT LUST list, as provided by EDR, and dated 01/20/2016 has revealed that there are 3

UT LUST sites within approximately 0.5 miles of the target property.

State and tribal registered storage tank lists

UT UST: The Underground Storage Tank database contains a listing of Facility, Owner, Location & Tanks not Closed or Removed. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the Department of Environmental Quality's Facilities with at Least One Non-exempt Tank.

A review of the UT UST list, as provided by EDR, and dated 01/20/2016 has revealed that there are 8 UT UST sites within approximately 0.25 miles of the target property.

ADDITIONAL ENVIRONMENTAL RECORDS

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 12/09/2015 has revealed that there are 6 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 6 EDR Hist Auto

sites within approximately 0.125 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page

Not reported	3520 GALAXY PARK PL	NNE 0 - 1/8 (0.118 mi.)	26	38

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there are 4 EDR Hist Cleaner sites within approximately 0.125 miles of the target property.

FINDS:

Registry ID: 110005211564

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Biennial Reports:

Last Biennial Reporting Year: 2013

Annual Waste Handled:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Amount (Lbs): 248088.2

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
Amount (Lbs): 11208

Waste code: D004
Waste name: ARSENIC
Amount (Lbs): 3853

Waste code: D008
Waste name: LEAD
Amount (Lbs): 30

Waste code: D011
Waste name: SILVER
Amount (Lbs): 2789

Waste code: D035

FAIRCHILD SEMICONDUCTOR (Continued) **1000260445**

Waste name: METHYL ETHYL KETONE
Amount (Lbs): 695

Waste code: D039
Waste name: TETRACHLOROETHYLENE
Amount (Lbs): 177

Waste code: F003
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
Amount (Lbs): 241501.2

Environmental Interest/Information System

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

The CIM (Utah - Common Identifier Mechanism) is Utah's Department of Environmental Quality (UDEQ) mechanism for compliance and permitting operations.

Environmental Interest/Information System
NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in

DYNO NOBEL INC. (FKA IRECO) (Continued) **1000176801**

regions and states with cooperative agreements, enforcement actions, and settlements.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 03/07/2016

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

State- and tribal - equivalent CERCLIS

SHWS: This state does not maintain a SHWS list. See the Federal CERCLIS list and Federal NPL list.

State Hazardous Waste Sites. State hazardous waste site records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. Available information varies by state.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR Hist Cleaner: EDR Exclusive Historic Dry Cleaners

EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

NY MANIFEST: Facility and Manifest Data
Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a TSD facility.

Date of Government Version: 05/01/2016
Date Data Arrived at EDR: 05/06/2016
Date Made Active in Reports: 06/17/2016

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.
Public Schools

West Map:	6008625 COPPERTON, UT
Version Date:	2014

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

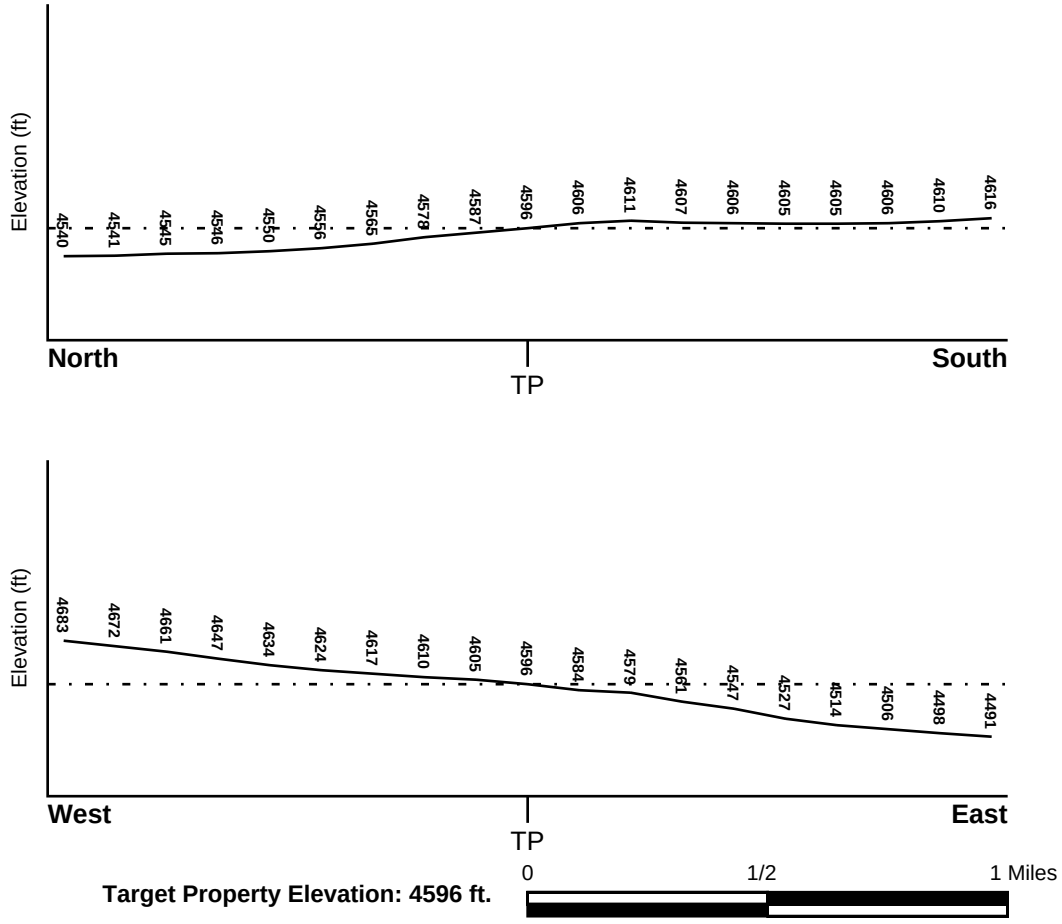
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General NE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Target Property Elevation: 4596 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
SALT LAKE, UT	YES - refer to the Overview Map and Detail Map

Flood Plain Panel at Target Property: 49035C - FEMA DFIRM Flood data

Additional Panels in search area: Not Reported

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
MIDVALE	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: RED ROCK

Soil Surface Texture: silt loam

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class: Well drained

Hydric Status: Unknown

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	3 inches	silt loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay. FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 4.23 Min: 1.41	Max: 7.8 Min: 7.4
2	3 inches	20 inches	silty clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 1.41 Min: 0.42	Max: 7.8 Min: 7.4
3	20 inches	27 inches	silty clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 1.41 Min: 0.42	Max: 8.4 Min: 7.9

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
4	27 inches	40 inches	clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 4.23 Min: 1.41	Max: 8.4 Min: 7.9
5	40 inches	44 inches	silt loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay. FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 4.23 Min: 1.41	Max: 9 Min: 8.5
6	44 inches	59 inches	silty clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 1.41 Min: 0.42	Max: 9 Min: 8.5

Soil Map ID: 2

Soil Component Name: BUTTERFIELD

Soil Surface Texture: gravelly silt loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 127 inches

Depth to Watertable Min: > 0 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Map ID: 6

Soil Component Name: BINGHAM

Soil Surface Texture: gravelly loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Unknown

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory
Source: Utah Geological Survey
Telephone: 801-537-3300

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1926 through 2013. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR is licensed to reproduce certain City Directory works. Reproduction of City Directories without permission of the publisher may be a violation of copyright.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

Executive Summary

The Environmental Protection Agency (EPA) has conducted the second Five-Year Review of the response actions implemented at Operable Units (OU) 1, 4, 5, 10, and 11 of the Kennecott South Zone Superfund Site (the Site) near Copperton in Salt Lake County, Utah. This review was conducted from August 2009 through July 2010, five years after the first Five-Year Review completed in June 2004.

A complete review with associated protectiveness statements was performed for OUs 1 and 5 (Bingham Creek and Anaconda Tailings, respectively). Treatment of the remaining OUs was limited to a summary of the OU status.

Operable Unit 1 consists of the Bingham Creek Channel and surrounding historic floodplain. The up- and down-stream limits include the Kennecott Large Bingham Reservoir on the west to the Jordan River on the east, a distance of about 10 miles.

The OU is divided into the Bingham Creek Channel and Bingham Creek Residential Soils, which include certain residential developments in the floodplain. During the early days of mining, wastes from mining and mineral processing (mine dumps, mill tailings, and smelter slag) were dumped directly into Bingham Creek or stored adjacent to the creek where they were subject to erosion and transport to the creek. The concentrations of arsenic and lead found in the Bingham Creek channel in a residential area averaged 202 milligrams per kilogram (mg/Kg) and 5,661 mg/Kg, respectively.

Operable Unit 5 includes the Anaconda Tailings, also known as Copperton Tailings, ARCO Copperton Tailings and Utah-Apex Tailings. The tailings consisted of approximately 3.5 million tons of lead, arsenic, zinc, and silver-bearing, fine grained sediments covering 96 acres along the south side of Bingham Creek. Average arsenic and lead concentrations were found to be 394 mg/Kg and 6,244 mg/Kg, respectively. These wastes are now consolidated into a 41 acre capped repository. Operable Unit 5 also includes Bastian Ditch which originates in the vicinity of the Anaconda Tailings and roughly follows Utah Highway 111 southward.

Response actions at OU1 and OU5 prior to issuance of the 1998 ROD were deemed to have adequately addressed risks to human health and the environment such that the ROD called for no further action. Response actions involved the excavation and consolidation of mine wastes and contaminated soils from OU1 and OU5 into capped repositories, one of which is located on OU5. Areas where mine waste and soils containing lead above land-use based cleanup levels remained were covered in place (residential areas) and/or subject to land use controls. Land use controls are the responsibility of local municipal and county government.

Although the residential area response actions at OU1 were conducted in accordance with the Action Memoranda (and therefore may be functioning as intended), it is not clear from the site files whether all residential properties ultimately were cleaned to the final lead standard of 1,100 mg/Kg.

This is due to an inconsistency in the lead action level required in the Action Memoranda for the Phase I residential removal action (2,500 mg/Kg) and the Phase II and III residential removal actions (1,100 mg/Kg). The OU1 ROD identifies the appropriate action level for lead in a residential setting as 1,100 mg/Kg. Therefore, if the Phase I residential cleanup achieved a lead standard of 2,500 mg/Kg, this portion of the remedy would not be functioning as intended by the ROD.

Land use controls and regular inspections of those response actions that left waste in-place are necessary to provide future protectiveness of the remedy. Future land development and disturbance of either capped or soil covered wastes by residents and by erosion may compromise the protectiveness of the remedy selected at OU1 and OU5.

Land use controls in OU1 and OU5 have not been fully implemented. Regular inspections of the Bingham Creek Channel response actions in OU1 were not performed. However, review of relevant documents and observations made at OU1 and OU5 during the Five-Year Review indicate the following:

- Response actions where waste was left in-place are in good condition.
- Limited development has occurred in OU1 since the first Five-Year Review and this development is under EPA or UDEQ oversight.
- No development or change in land use has occurred at OU5. Operable Unit 5 remains within Kennecott's secured property boundary and land use control is still under the control of ARCO, the parcel owner.

A protectiveness determination of the remedy at OU1 cannot be made at this time until further information is obtained. Further information will be obtained by determining what arsenic and lead concentration standards the fifty properties under the Phase I residential removal action were remediated to. It is expected that this additional information will be obtained by December 31, 2010, at which time a protectiveness determination will be made. In order for the remedy to be protective in the long-term, land use controls and annual inspections and maintenance of certain response actions required by decision documents must be fully implemented.

The remedy at OU5 currently protects human health and the environment through actions that isolate contaminants. However, in order for the remedy to be protective in the long-term, land use controls must be fully implemented.

It is anticipated that ARARs and cleanup levels will be evaluated for the entire Kennecott Site as part of the development of an Explanation of Significant Differences (ESD). The ESD will pertain to all RODs except OU2. This evaluation is expected to be completed in the spring of 2011.

A number of issues were identified and will be addressed as summarized in the following tables.

Five-Year Review Summary Form

SITE IDENTIFICATION		
Site name *(from WasteLAN)*: Kennecott South Zone		
EPA ID *(from WasteLAN)*: UTD000826404		
Region: 8	**State:** UT	**City/County**: Copperton/Salt Lake County

SITE STATUS	
NPL status: Final ☐ Deleted X Other (specify) proposed and withdrawn	
Remediation status (choose all that apply): Under Construction X Operating X Complete	
Multiple OUs? X YES NO	**Construction completion date**: NA not on NPL
Has site been put into reuse? X☐YES NO	

REVIEW STATUS	
Reviewing agency: x EPA State ☐ Tribe ☐Other Federal Agency	
Author name: Rebecca Thomas	
Author title: Project Manager	**Author affiliation:** US Environmental Protection Agency
Review period: August 2009 through July 2010	
Date(s) of site inspection: 7/25/09, 10/6/09, 11/18/09, 12/01/09	
Type of review: X Post-SARA ☐Pre-SARA ☐NPL-Removal only ☐Non-NPL Remedial Action Site X NPL State/Tribe-lead ☐Regional Discretion	
Review number: 1 (first) X2 (second) 3 (third) ☐Other (specify)	
Triggering action: ☐ Actual RA Onsite Construction at OU #___ ☐Actual RA Start ☐ Construction Completion X Other (specify) – 5-years from the date of the first 5YR.	
Triggering action date: For OUs 1, 4, 5, 10, and 11 the trigger date is 5-years from the date of the 1st FYR (June 2004).	
Due date: June 2009	

*["OU" refers to operable unit.]

Five-Year Review Summary Form, cont'd.

Issues:

Item No.	Issues	Affects Current Protectiveness	Affects Future Protectiveness
Bingham Creek - Operable Unit No. 1			
1	Bingham Creek Channel annual inspection and reporting was not performed.	No	Yes
2	A maintenance and reporting program for Bingham Creek Channel response actions has not been developed or implemented.	No	Yes
3	Land use controls have not been implemented (including finalization and approval by EPA Region 8 and UDEQ) by West Jordan and South Jordan Cities and Salt Lake County.	No	Yes
4	A cleanup goal has not been identified at OU1 for arsenic under recreational, open space, commercial or industrial land uses or for lead under a commercial land use.	No	Yes
5	It is unclear what arsenic and lead cleanup levels were achieved at the residential properties addressed under the 1991 Action Memorandum (Phase I).	Yes	Yes
6	ARARs have not been reviewed as part of this Five-Year Review.	No	Yes
Anaconda Tailings - Operable Unit No. 5			
1	Land use controls have not been implemented by Salt Lake County. In addition, reporting on land use control performance was not required but are necessary to ensure that Institutional Controls (ICs) are functioning.	No	Yes
2	A one acre sized uncapped/uncovered waste pile is present at the toe of the Large Bingham Reservoir dam. Arsenic and lead concentrations at the surface of this feature are unknown.	No	Yes
3	ARCO is not required to provide reports of their operation, monitoring and maintenance activities for the cap at their repository. Reporting is necessary to demonstrate and document that such activities are occurring between Five-Year Reviews.	No	Yes
4	Segments of the Bastian Ditch may still contain tailings.	No	Yes
5	A cleanup goal has not been identified at OU5 for arsenic under recreational, open space, commercial or industrial land uses.	No	Yes
6	ARARs have not been reviewed as part of this Five-Year Review.	No	Yes

Five-Year Review Summary Form, cont'd.

Recommendations and Follow-up Actions:

Item No.	Issues	Recommendations and Follow-up Actions	Party Responsible	Oversight Agency	Milestone Date	Affects Protectiveness (Y/N)	
						Current/	Future
Bingham Creek - Operable Unit No. 1							
1	Bingham Creek Channel annual inspection and reporting was not performed.	EPA will begin annual inspection of response actions in the channel and will prepare a report for the site files.	EPA	EPA/UDEQ	6/30/11	No	Yes
2	A maintenance and reporting program for Bingham Creek Channel response actions has not been developed or implemented.	EPA and UDEQ will coordinate with local authorities to define roles for this portion of the remedy.	EPA/ UDEQ	EPA/UDEQ	6/30/11	No	Yes
3	Land use controls have not been implemented (including finalization and approval by EPA Region 8 and UDEQ) by West Jordan and South Jordan Cities and Salt Lake County.	EPA will provide the Cities and County with mapping showing the location of wastes remaining in-place. The Cities and County will develop, formalize and implement land use controls for OU1.	EPA/ UDEQ	EPA/UDEQ	6/30/11	No	Yes
4	A cleanup goal has not been identified at OU1 for arsenic under recreational, open space, commercial or industrial land uses or for lead under a commercial land use.	Select appropriate cleanup levels and document in an ESD to be prepared for the entire Kennecott Site (except for OU2).	EPA/UDEQ	EPA/UDEQ	Spring 2011	No	Yes
5	It is unclear what arsenic and lead cleanup levels were achieved at the residential properties addressed under the 1991 Action Memorandum (Phase I).	Determine what arsenic and lead concentration standard the fifty properties under Phase I were remediated too.	UDEQ/EPA	UDEQ/EPA	12/31/10	Yes	Yes
6	ARARs have not been reviewed as part of this Five-Year Review.	Perform ARARs review and document in ESD.	UDEQ/EPA	UDEQ/EPA	Spring 2011	No	Yes

Recommendations and Follow-up Actions (cont'd):

Item No.	Issues	Recommendations and Follow-up Actions	Party Responsible	Oversight Agency	Milestone Date	Affects Protectiveness (Y/N)	
						Current/	Future
Anaconda Tailings - Operable Unit No. 5							
1	Land use controls have not been implemented by Salt Lake County. In addition, reporting on land use control performance was not required but is necessary to ensure that ICs are functioning.	Develop, formalize and implement land use controls for OU5 and report on their implementation and functionality.	UDEQ/EPA	EPA/UDEQ	6/30/11	No	Yes
2	A one acre sized uncapped/uncovered waste pile is present at the toe of the Large Bingham Reservoir dam. Arsenic and lead concentrations at the surface of this feature are unknown.	Develop a land use change restriction.	ARCO	EPA/UDEQ	6/30/11	No	Yes
3	ARCO is not required to provide reports of their operation, monitoring and maintenance activities for the cap at their repository. Reporting is necessary to demonstrate and document that such activities are occurring between Five-Year Reviews.	UDEQ will perform annual inspections and will document the condition of the remedy.	UDEQ	EPA/UDEQ	12/31/10	No	Yes
4	Segments of the Bastian Ditch may still contain tailings.	Develop a land use change restriction.	EPA/ UDEQ	EPA/UDEQ	6/30/11	No	Yes
5	A cleanup goal has not been identified at OU5 for arsenic under recreational, open space, commercial or industrial land uses.	Select appropriate cleanup levels and document in an ESD to be prepared for the entire Kennecott Site (except for OU2).	EPA/ UDEQ	EPA/UDEQ	Spring 2011	No	Yes
6	ARARs have not been reviewed as part of this Five-Year Review.	Perform ARARs review and document in an ESD to be prepared for the entire Kennecott Site (except for OU2).	EPA/ UDEQ	EPA/UDEQ	Spring 2011	No	Yes

Protectiveness Statement(s):

The following protectiveness statements apply to OU1 and OU5.

OU1

A protectiveness determination of the remedy at OU1 cannot be made at this time until further information is obtained. Further information will be obtained by determining what arsenic and lead concentration standards the fifty properties under the Phase I residential removal action were remediated to. It is expected that this additional information will be obtained by December 31, 2010, at which time a protectiveness determination will be made. In order for the remedy to be protective in the long-term, land use controls and annual inspections and maintenance of certain response actions required by decision documents must be fully implemented.

OU5

The remedy at OU5 currently protects human health and the environment through actions that isolate contaminants. However, in order for the remedy to be protective in the long-term, land use controls must be fully implemented.

Other Comments:

In order for land use controls to be fully implemented at OU1 and OU5, accurate mapping of waste or contaminated soils left in-place must be developed.

A. INTRODUCTION

A.1. Purpose of the Review

The purpose of Five-Year Reviews is to determine whether response actions at a site are protective of human health and the environment. The methods, findings, and conclusions of reviews are documented in Five-Year Review reports. In addition, Five-Year Review reports identify issues found during the review, if any, and makes recommendations to address them.

A.2. Authority for Conducting the Five-Year Review

The U.S. Environmental Protection Agency (EPA) is preparing this second Five-Year Review pursuant to the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) §121 and the National Contingency Plan (NCP). CERCLA §121 states:

> *If the President selects a remedial action that results in any hazardous substances, pollutants, or contaminants remaining at the site, the President shall review such remedial action no less often than each five years after the initiation of such remedial action to assure that human health and the environment are being protected by the remedial action being implemented. In addition, if upon such review it is the judgment of the President that action is appropriate at such site in accordance with section [104] or [106], the President shall take or require such action. The President shall report to the Congress a list of facilities for which such review is required, the results of all such reviews, and any actions taken as a result of such reviews.*

The EPA interpreted this requirement further in the NCP; 40 CFR §300.430(f)(4)(ii) states:

> *If a remedial action is selected that results in hazardous substances, pollutants, or contaminants remaining at the site above levels that allow for unlimited use and unrestricted exposure, the lead agency shall review such action no less often than every five years after the initiation of the selected remedial action.*

The response actions conducted at the Site resulted in Site conditions that do not allow for unlimited use and unrestricted exposure. Therefore a Five-Year Review is required by statute.

A.3. Who Conducted the Five-Year Review

The EPA Region 8 conducted the second Five-Year Review of response actions implemented at Kennecott South Zone Site Operable Units 1, 4, 5, 10 and 11 near the town of Copperton, Utah. This review was conducted from August 2009 through July, 2010. This report documents the results of the review.

HDR Engineering, Inc. (HDR) of Denver, Colorado was retained by EPA Region 8 to provide technical support during preparation of the Five-Year Review Report.

A.4. Other Review Characteristics

The status of response actions at the OUs addressed in this Five-Year Review varies and so the treatment of each OU also varies, as follows:

- OU1 Bingham Creek - This OU is in post-construction operation and maintenance (O&M) with wastes remaining in-place. Therefore, this OU is subjected to a full review including a protectiveness statement.
- OU4 Large Bingham Reservoir - Performance measures at this OU are limited to compliance with a Utah ground water permit. Therefore, the assessment is limited to degree of permit compliance.
- OU5 Anaconda Tailing - This OU is in post-construction O&M with wastes remaining in-place. Therefore, this OU is subjected to a full review including a protectiveness statement.
- OU10 Copperton Soil - Conditions at this OU allow for unrestricted land use. Therefore, no further five-year reviews are necessary and the assessment is limited to that subject.
- OU11 Bingham Canyon - All but three of the historic mining facilities comprising this OU have been either buried or subsumed by the open pit of the active mine operation. Therefore, the assessment is limited to this subject.

B. BINGHAM CREEK – OU1

B.1. Site Chronology

Table 1 summarizes the important events and relevant dates in the Site's chronology.

Table 1 - Chronology of Site Events

Date	Activity
Aug-90	PA/SI at Bingham Creek
May-91	Action Memo, Phase 1, removal action at residential areas along Bingham Creek, Fund-lead, excavate contaminated soils down to depth of 18" and replace with clean fill.
May-91	AOC, CERCLA-VIII-91-1 1, Kennecott agrees to build a soils repository and haul the excavated soils to their repository.
Dec-91	Completion of Phase 1 removal, cleanup of 52 residences. The interim removal action level is 2500 ppm lead in soils.
Jan-93	Action Memo, Phase 2, cleanup of the Bingham Creek Channel
Feb-93	UAOs issued to Kennecott and ARCO, CERCLA- VIII-93-10, removal of top 3 feet or more of contaminated sediments, haul contaminated sediments to repositories, regrade and revegetate channel.
Dec-95	Completion of Phase 2 removal. The removal action level is 2000 ppm lead in sediments.
Jun-95	Action Memo, Phase 3, cleanup of remainder of residences along Bingham Creek using final action level of 1100 ppm lead in soils.
Jul-95	UAO issued to ARCO, CERCLA- VIII- 95-19, excavation of contaminated soils down to maximum depth of 18", removal of soils to ARCO's repository, regrade with fill, and revegetate with sod for residences.
Dec-97	Completion of Phase 3 removal. The removal action level (final) was 1100 ppm lead in soils.
Sep-98	Record of Decision, No Further Action Required
Dec-98	RD/RA Consent Decrees with Kennecott and ARCO
Jun-04	First Five-Year Review
2005	Repair to erosional feature identified during the First Five-Year review.

B.2. Background

Location and Setting

Operable Unit 1 consists of the Bingham Creek Channel and surrounding historic floodplain. The up- and down-stream limits include the Kennecott Large Bingham Reservoir on the west to the Jordan River on the east, a distance of about 10 miles (See Map of OU1 in Appendix A). The creek course travels easterly from the Large Bingham Reservoir through Salt Lake County towards the Jordan River.

The OU is divided into the Bingham Creek Channel and Bingham Creek Residential Soils, which include certain residential developments in the floodplain.

Bingham Creek Channel:

The channel transects an eastward, gently-sloping alluvial plain that extends from the foot of the Oquirrh Mountains front to the Jordan River. Elevation ranges from 5,300 feet above sea level (ASL) at the Large Bingham Reservoir to 4,300 feet ASL at the confluence of the creek with the Jordan River.

The upper part of the creek channel is located on private land used for farming, mining, and industrial purposes. Portions of the lower part of the creek channel are located on public lands used for open space and recreation, but is bounded by suburban residential, commercial, industrial, and agricultural development. Other portions of the creek channel are located on privately owned residential property. In some cases, the creek has been rerouted in man-made ditches, channels, and culverts with suburban development occurring on the historic channel.

Bingham Creek is generally an intermittent, losing stream that flows only during peak runoff periods or during major storm events. However, as the channel progresses east of 3200 West, various springs discharge groundwater into the creek. In the lower creek section, Bingham Creek flows most of the year.

The channel course, over time, has meandered and overflowed during flood events that have been caused by natural and human-caused events. Historically, the creek has abandoned old channels and formed new channels spreading contaminated alluvial and waste materials across broad areas. The principal aquifer under the creek is recharged along the foothills of the Oquirrh Mountains and discharges downgradient at the Jordan River. Ground water is being addressed as part of another operable unit (OU2).

Bingham Creek Residential Soils:

The Bingham Creek Residential Soils area consists of certain residential development areas in the floodplain of Bingham Creek. Located in the cities of South Jordan and West Jordan, numerous residences were built on the floodplain or over historic channels.

Since most of the historic flow of the creek was diverted by early farmers and ranchers, some creek-borne contaminants were also found near irrigation ditches. Neighborhoods affected include Jordan View Estates, Meadow Green, Fahnian Ranchettes, Vista West, Sugar Factory, and Brookside. Approximately 125 individual residences were addressed as part of three removal actions. Most of these residences were located within 2 blocks of the creek channel.

Site History and Extent of Contamination

During the early days of mining, wastes from mining and mineral processing (mine dumps, mill tailings, and smelter slag) were dumped directly into Bingham Creek or stored adjacent to the creek where they were subject to erosion and transport to the creek. Mining wastes contained elevated levels of lead and arsenic.

Over the years, especially during flood events, these mining and processing wastes washed downstream where they were deposited in creek channels and floodplain.
Lands traversed by Bingham Creek were originally agricultural, but with the growth of Salt Lake City suburbs, several residential neighborhoods were built along the creek, on floodplains, and over historical creek channels.

Concentrations of arsenic and lead found in the Bingham Creek channel in a residential area averaged 202 milligrams per kilogram (mg/Kg) and 5,661 mg/Kg, respectively.

Baseline Risk Assessment

Human Health:

The summary of site risks in the OU1 ROD included the following conclusions:

- A strong relationship exists between arsenic and lead concentrations in soil with arsenic levels about 4% of lead concentrations.
- Other contaminants such as cadmium were present at low levels, below any plausible residential risk-based concentration for soils.
- An evaluation of lead concentrations in soil and clean-up levels was made with the intent of being protective under a residential land use scenario. A range of values were developed using the Integrated Exposure Uptake Biokinetic Model. The following Site-specific parameters were used to help make a risk management decision for the cleanup values.
    - Bioavailability of lead in soil using a juvenile swine model.
    - Relationship between the concentration of lead in soil and house dust.
    - Exposure frequency and duration.
    - Garden vegetable uptake of metals from soil.
- Arsenic was also evaluated and a value was selected that would be protective under a residential land use scenario. This value was developed using the Site-specific measurements listed above under the discussion of lead.

Regulators and Stakeholders developed cleanup goals. In the development of these cleanup goals there were many issues considered including an extensive blood lead and urinary arsenic study conducted in the area.

The range of lead and arsenic concentrations proposed for the cleanup goal was presented to a delegation of Bingham Creek residents at a public meeting. Reasons for uncertainties were explained and residents preferred the clean-up values of 1,100 mg/Kg for lead and 100 mg/Kg for arsenic. As a result, final lead and arsenic cleanup levels were established for residential land use, including vacant land within residential neighborhoods.

Vacant lands outside residential areas were evaluated on the basis of current and future land use. As discussed in Section B.3., response actions conducted in these vacant lands (Bingham Creek channel), employed a lead cleanup level of 2,000 mg/Kg. The ROD concluded that this cleanup level was sufficiently protective for open space, recreational and industrial land uses.

Ecological Risk:

At the time of the ROD the majority of Kennecott South Zone, including OU1, had land uses that provided relatively little habitat for wildlife where meaningful contact with hazardous constituents would occur. Thus, a qualitative ecological risk evaluation was performed as part of a Phase III Endangerment Assessment. In addition, Kennecott conducted a site-wide ecological risk assessment for areas of the larger Kennecott South Zone and North Zone which have substantial wildlife habitat. Although wildlife occasionally visits the area, the land is not primarily wildlife habitat.

Bingham Creek is generally an intermittent, losing stream that flows only during peak runoff periods or during major storm events. However, as the channel progresses east of 3200 West, various springs discharge groundwater into the creek. In the lower creek section, Bingham Creek flows most of the year.

The 1998 OU1 ROD states that "the creek serves mainly as a drainage ditch and does not support aquatic life." Aquatic impacts in the Jordan River are possible following storm events or floods. The Jordan River is not covered under the OU1 decision documents and impacts there were not evaluated. Thus, EPA concluded in the OU1 ROD that there are no actual or threatened releases from OU1 (as well as OU 4, 5, 10, 11 and 17) that pose a present or potential future threat to the environment.

B.3. Response Actions

Decision Documents and Responsible Party

The Kennecott South Zone Site (including OU1) was proposed for the National Priorities List (NPL) on January 18, 1994. Utah Department of Environmental Quality (UDEQ) and EPA withdrew the proposal to list the Kennecott South Zone Site on the NPL in 2008.

In September 1995, the UDEQ, EPA and Kennecott entered into a Memorandum of Understanding (MOU). Pursuant to the terms of the MOU, Kennecott agreed to complete numerous cleanup projects for both the South Zone and nearby Kennecott North Zone Site. Upon Kennecott's completion of the cleanup projects, EPA agreed to take no further action related to final listing of the sites.

On July 2, 2008 EPA Region 8 issued, with concurrence from UDEQ, a request to EPA Headquarters to withdraw the proposed listing of the South Zone Site. Notice within the Federal Register in early September signifies the South Zone's withdrawal.

The following summarizes decision documents and the responsible parties' specific to OU1.

Bingham Creek Channel:

Contaminated tailings were removed from Bingham Creek channel and a number of road crossings and utility corridors were cleaned up in accordance with a January 1993 Action Memorandum. Kennecott and ARCO participated in portions of this work under provisions of the following Orders:

- Unilateral Administrative Order (UAO), Docket No. CERCLA-VIII-93-10, February 18, 1993
- Administrative Order on Consent (AOC), CERCLA VIII 92-01, 1992

Bingham Creek Residential Soils:

Surface soils contaminated with mining wastes were excavated and removed from residential properties in the Bingham Creek floodplain in accordance with May 1991 and June 1995 Action Memoranda. Kennecott and ARCO participated in portions of this work under provisions of the following Orders:

- AOC, Docket No. CERCLA-VIII-91-11, May 20, 1991.
- UAO, CERCLA VIII-95-19 July 21, 1995 (amended October 31, 1995).

A ROD was issued in 1998 for OU1 (as well as other OUs in the Kennecott South Zone). The ROD selected No Further Action. However, as discussed below in the Summary of Response Actions, O&M and other activities are required under the Action Memoranda after the date of the ROD.

Summary of Response Actions

All response actions at OU1 were conducted as time critical removal actions and include.

Bingham Creek Channel:

- Remove mine wastes containing lead over 2,000 mg/Kg to a minimum depth of three feet from Large Bingham Reservoir dam to the downstream side of Brookside Trailer Park.
- Cover remaining contamination and re-contour the creek bed.
- Remove mine wastes from road and utility creek crossings.
- Haul excavated wastes to Kennecott Bluewater Repository or Anaconda Tailings (OU5).

Bingham Creek Residential Removal:

- Excavate soil from 52 properties containing lead above 2,500 mg/Kg and from 75 properties containing lead above 1,100 mg/Kg to a maximum depth of 18-inches and replace with clean soil (conducted in 1991 and 1995-7, respectively).
- Haul excavated wastes to Kennecott Bluewater Repository or Anaconda Tailings (OU5).

Based on UDEQ review of site files, it remains uncertain whether the 52 properties described above were ultimately subjected to further removal action(s) to meet the final lead standard of 1,100 mg/Kg and the arsenic standard of 100 mg/Kg. This is discussed further in sections B.6, B.7 and B.8.

At the time of the ROD, the lower portion of Bingham Creek drainage, located in the Jordan River floodplain was (and still is) used for agriculture, ranching, and industry with no plans to develop this area for residential use. The City of West Jordan is obligated under the Action Memoranda to manage this area through land use planning, zoning, and building permit authorities.

Operation, Maintenance, Monitoring and Reporting

Various documents in the administrative record identify the need for, or an obligation for, local governments or private parties to inspect and maintain response actions and to prepare report on such activities as part of the long-term supervision and operation of the remedy.

The responsibilities, responsible party and controlling document(s) include:

Annual Inspection and Maintenance of the Bingham Creek Channel:

- A January 28, 1993 Action Memorandum states that "*it is anticipated that State, City and County governments will be involved to ensure long-term maintenance of the response action".*
- 1992 AOC with ARCO required inspection and repairs to response actions in the channel for five-years. The 2004 Five-Year Review Report stated that the five-year maintenance period had recently expired and that Salt Lake County had assumed the responsibility for repairs to the channel (as well as the implied need to inspect the channel for necessary repairs). The County accepted responsibility to ensure long-term control over land redevelopment through their existing ordinances and other land use controls in a November 4, 1998 letter to EPA and UDEQ.
- The 2004 Five-Year review Report states that *"in the future, the channel itself will be inspected by EPA contractors (on an annual basis)".*

Based on these statements, it appears that annual inspection of the channel since at least 2004 is the responsibility of EPA and Salt Lake County has agreed to maintain land use controls. The level of compliance with these obligations is discussed in Section B.6. Although the 2004 Five-Year review identified the County as responsible for repairs to the channel, the County has not formally been asked to accept this responsibility.

Control of Land Uses (Bingham Creek and Residential Soils):

- A November 4, 1998 letter from Salt Lake County to EPA and UDEQ identifies the County as responsible for long-term management of properties cleaned-up in unincorporated areas of the County. Management is to include use of existing county ordinances involving land use planning, zoning, and building permits.

- The 1998 OU1 ROD states that the Cities of West Jordan and South Jordan have agreed to supervise long-term management of the site using existing authorities for land use planning, zoning and building permits.
- The 2004 Five-Year Review Report reiterated the responsibilities of the Cities discussed in ROD and explained that the City of West Jordan has received a Brownfields Grant to design a long-term plan for Lower Bingham Creek and nearby areas.

Based on these statements, the Cities of West Jordan and South Jordan have been responsible for land use controls within city limits at least since the last Five-Year Review. Salt Lake County has similar responsibilities for unincorporated portions of OU1. Level of compliance with these obligations is discussed in Section B.6.

B.4. Progress Since Last Five-Year Review

The First Five-Year Review included the following protectiveness statement:

> *"The remedy at OU1 is currently protective of human health and the environment and exposure pathways that could result in unacceptable risks are being controlled."*

Only one issue was identified during the last Five-Year Review (2004). It involved an erosion gully located where drainage from Trans Jordan Landfill access road and Route 111 discharges into Bingham Creek. Trans Jordan Landfill in cooperation with South Jordan City and Kennecott agreed to make the repair.

Based on a communication with Doug Bacon of UDEQ, the repair was completed before the end of 2005 and involved installation of a new drainage culvert and riprap. Photo Nos. 28-30 in Appendix B illustrates the post-repair condition.

Based on discussions with West Jordan and South Jordan Cities, as well as Utah Transit Authority (UTA), certain development planning and infrastructure construction activities have occurred since the last Five-Year Review. These include:

- West Jordan instituted a soils ordinance within the past year requiring developers to enlist in UDEQs Voluntary Cleanup Program (VCP) if there is contamination known or detected on the property intended to be redeveloped. However, the ordinance is undergoing revision and the existing ordinance has not been reviewed by EPA or UDEQ.
- South Jordan described a "hazardous Geologic Map" that is in development by the city engineering department. This map reportedly will illustrate "sensitive land areas" within the city to support land use controls. However, EPA and UDEQ have not been involved in the development of this document or other activities related to land use controls.
- UTA is constructing a Light Rail project in West Jordan traversing portions of OU1 and incorporating the historic Union Pacific rail line not previously addressed during removal actions. UDEQ has been providing oversight of this project.

B.5. Five-Year Review Process

Administrative Components

This is the second Five-Year Review for OU1. The Five-Year Review was led by Rebecca Thomas, EPA Project Manager. The following Team Members participated in the review:

- Doug Bacon, UDEQ Remedial Project Manager
- Scott Everett, UDEQ Toxicologist
- David Allison, UDEQ Community Involvement Coordinator

EPA Contractors:

- Kenneth Napp, HDR Engineering, Inc.

This Five-Year Review consisted of the following activities: a review of relevant documents, a site inspection and meeting with representatives of EPA, UDEQ and Kennecott. The schedule for the review was extended through March 2010.

Community Notification and Involvement

A display ad to announce the Five-Year Review and to invite public input was published in the Salt Lake Tribune and Deseret News on Oct. 2, 2009 and in the West Valley Journal on Oct. 15, 2009.

Superfund community involvement staff from UDEQ conducted interviews with various Kennecott South Zone stakeholders during the period, September to December, 2009. These interviews are valuable to the five-year review process. Respondents provide their views regarding the Kennecott South Site cleanup and its continued protectiveness. Often, EPA and UDEQ discover new information from these interviews to be considered in the five-year review. A summary of the interviews is provided as Appendix C.

Document Review

In performing this Five-Year Review, the following documents were reviewed:

- First Five-Year Review Report, Kennecott South Zone OU3 Butterfield Canyon Creek, Herriman Residential and Agricultural lands, OUs 6, 7, 17 and 18, September 30, 2009.
- Letter from EPA to Masters at Mountain View Development Company regarding requirements to ensure development is consistent with the OU1 remedy. April 8, 2009.
- First Five-Year Review Report for Kennecott South Zone OU1, 4, 5, 10, 11, 17, prepared by EPA, June 2004.
- Preliminary Remediation Goals for Addressing Risks to Human Health from Exposure to Chemicals in Kennecott Soil, prepared by EPA, December 1999.

- Letter from Salt Lake County to EPA regarding long-term management of Bingham Creek properties. November 4, 1998
- EPA Record of Decision, Kennecott (South Zone) OU1, November 3, 1998.
- Action Memorandum for a Time-Critical Removal Action at the Bingham Creek Channel – Phase Two Site. January 28, 1993.

The following individuals provided supplemental technical information:

- Rebecca Thomas - EPA
- Doug Bacon - UDEQ

Data Review

No analytical or other data relevant to this Five-Year Review was collected during the review period. Analytical data collection was not required under the remedy. Annual inspections and other elements of the institutional control portion of the remedy that might have resulted in reports or data were not performed as discussed in Section B.6.

Site Inspection

The Site Inspection was performed on July 25, 2009, by the following personnel:

- Rebecca Thomas, EPA Remedial Project Manager
- Doug Bacon, UDEQ Remedial Project Manager
- Dave Allison, UDEQ Community Relations
- Brian Vinton, North American Mine Services Inc.(contractor to Kennecott Utah Copper)

The purpose of the Site Inspection was to observe current Site conditions and remedy elements. The Site Inspection consisted largely of a drive-by tour of the most readily observable portions of the Bingham Creek Channel from the Jordan River, upstream to the Anaconda Tailings (OU5).

Where observed, the stream banks appeared heavily vegetated with no obvious erosional features. The channel itself is approximately 10 miles long and so observation of the entire channel was not possible during a one-day Site inspection. As discussed in Section B.3., the remedy for OU1 includes an annual inspection of the entire channel by EPA as well as Salt Lake County.

Portions of the residential area of OU1 subjected to response actions to address contaminated yard soils were also observed from roadways during the Site visit. Other than a residential development under construction (2690 West 8410 South in West Jordan), all properties observed appeared in good condition and were well maintained. As discussed in Section B.6., the new residential development is being constructed consistent with the OU1 remedy.

Additional site visits were made by Doug Bacon, the UDEQ Project Manager during the period from September to December 2009. One of these visits (December 1, 2009) was made to address specific questions about the site condition that arose during the preparation of this report.

Portions of the Bingham Creek channel that were not seen during the July 25, 2009 Site Inspection were observed by UDEQ personnel on October 6 and December 1, 2009. The condition of the channel appeared to be good, including the response actions that left mine waste in-place. Photographs of the channel and surrounding lands taken on July 25 and December 1, 2009 are provided as Photo Nos. 1-10 in Appendix B.

In addition, two development activities have occurred since the first Five-Year Review. These include:

- UTA light rail project in West Jordan.
- Masters at Mountain View development at 2690 West 8410 South in West Jordan.

The UTA and Masters at Mountain View projects are being constructed with oversight by UDEQ and EPA, respectively.

B.6. Technical Assessment

Question A: Is the Remedy Functioning as Intended by the Decision Documents?

No, the remedy is not functioning as intended by the decision documents.

The decision documents for the Site include:

- 1991 Action Memorandum (Phase I - Bingham Creek Channel Response Action)
- 1993 Action Memorandum (Phase II - Residential Response Action)
- 1995 Action Memorandum (Phase III - Residential Response Action)
- 1998 OU1 ROD

Remedy elements identified in decision documents are summarized below. An assessment of remedy element functionality is also provided.

1. Bingham Creek channel covered wastes.

   This response action was constructed in accordance with the 1991 Action Memorandum. Its condition at the time of the July 25, 2009 Site Inspection (and during subsequent observations made by UDEQ) appeared good with stable and heavily vegetated banks. As discussed below under Item No.2, annual inspections of the channel have not been formally conducted by EPA since the last Five-Year Review. However, the channel condition observed during this Five-Year Review shows that this remedy element is functioning as intended.

2. Maintenance, Monitoring and Reporting of Bingham Creek channel covered wastes.

Based on information summarized in Section B.3., annual inspections (and reporting) must be performed, with EPA currently holding the position of responsibility. Salt Lake County accepted responsibility to ensure long-term control over land redevelopment through their existing ordinances and other land use controls in a November 4, 1998 letter to EPA and UDEQ.

Based on the information available, such inspections, maintenance and reporting have not been performed on a regular basis. Therefore, this remedy element is not functioning as intended in the 1993 Action Memorandum and as described in the First Five-Year Review.

3. Bingham Creek Residential Removal.

This response action was constructed in accordance with the 1993 and 1995 Action Memoranda. Under the response actions, contaminants of concern in soil present above action levels identified in the Action Memoranda were removed to a depth of 18-inches and replaced with clean fill. Therefore, the response action will remain functioning as intended under the Action Memoranda unless the clean backfill is breached such that contaminants above action levels (if any) are present at the surface.

Although the response actions were conducted in accordance with the Action Memoranda (and therefore may be functioning as intended), it is not clear from the site files whether all properties ultimately were cleaned to the final arsenic standard of 100 mg/Kg or the final lead standard of 1,100 mg/Kg. This is due to an inconsistency in the lead action level required in the Action Memoranda for the Phase I removal action (2,500 mg/Kg) and the Phase II and III removal action (1,100 mg/Kg).

The OU1 ROD identifies the appropriate action level for lead in a residential setting as 1,100 mg/Kg. Therefore, if the Phase I residential cleanup achieved a lead standard of 2,500 mg/Kg, this portion of the remedy would not be functioning as intended by the ROD.

This is discussed further in sections B.7 and B.8.

4. Bingham Creek Land Use Controls.

Based on information summarized in Section B.3., land use controls on incorporated and unincorporated portions of OU1 are the responsibility of the Cities and County, respectively. These controls may, for example, regulate future development or residential homeowner activities such as excavations. Although documents reviewed for this report indicate the Cities and County have accepted

the responsibility, interviews with city officials indicate that land use controls have not been formalized and therefore, are not fully implemented.

It is also possible that the Cities and County do not possess accurate mapping to show the locations of waste remaining in-place. Therefore, this remedy element is not functioning as intended by the decision documents.

Interviews with the Cities and County and various recent site inspections indicate that, with one exception, no dwellings or other buildings have been constructed in OU1 since the last Five-Year Review. The single exception is the Masters at Mountain View development located at 2690 West 8401 South in West Jordan. This development is occurring with EPA involvement to ensure the development is consistent with the remedy. In addition, UTA is constructing light rail in West Jordan City. This work is being conducted under oversight from UDEQ and is being implemented consistent with the remedy.

Question B: Are the Exposure Assumptions, Toxicity Data, Cleanup Levels, and Remedial Action Objectives (RAOs) Used at the Time of the Remedy Selection Still Valid?

Yes, the exposure assumptions, toxicity data, cleanup levels and remedial action objectives used at the time of the remedy selection are still valid.

Exposure Assumptions and Toxicity Data

Cleanup levels set in the OU1 ROD are similar (and generally lower) to those adopted for identical land uses at several OUs in the Kennecott South Zone that underwent a Five-Year Review in 2009 (September 30, 2009). These include OU3 Herriman Residential & Agricultural Lands. At this OU, residential arsenic and lead cleanup levels are 100 mg/Kg and 1,200 mg/Kg, respectively. The cleanup levels for these chemicals in the OU1 ROD for residential land use are 100 mg/Kg and 1,100 mg/Kg.

Given the similarity in residential cleanup levels for lead and arsenic between OU3 and OU1, certain conclusion regarding the current protectiveness of these cleanup levels published in the OU3 Five-Year Review were incorporated into the following discussion.

Human Health

Changes in Exposure Pathways:

The OU1 ROD set cleanup levels for arsenic and lead for developed and undeveloped residential lands. It also established the adequacy of lead levels previously used in response actions in open space, recreational and industrial lands at the Kennecott South Zone Site.

However, an arsenic cleanup goal was not identified in the ROD for open space, recreational or industrial land uses. Therefore, a cleanup goal should be set for an exposure scenario involving arsenic and these land uses. In addition, the potential exists for commercial land uses in OU1.

No cleanup levels were set for this land use in OU1. Therefore, cleanup levels should be set for a commercial worker exposure pathway.

Changes in Toxicity, and Other Contaminant Characteristics:

There have been no changes in toxicity factors or characteristics for contaminants of concern (COCs) that were used to develop cleanup levels.

Changes in Risk Assessment Methods:

There has been no change to standardized methodology that could affect the protectiveness of response actions.

Expected Progress Towards Meeting RAOs:

Because past removal actions were designed to achieve final remedial cleanup goals, no further action was selected as the remedy for OU1 and no RAOs were identified.

Ecological Assessment:

EPA concluded in the OU1 ROD that there are no actual or threatened releases from OU1 (as well as OU 4, 5, 10, 11 and 17) that pose a present or potential future threat to the environment. Therefore, ecological impacts were not considered further in this Five-year review.

Cleanup Levels

ARAR-Based Cleanup Levels:

Site cleanup levels are risk-based concentrations. However, all ARARs including any potential ARAR-based cleanup levels will be evaluated for the entire Kennecott Site as part of the development of an Explanation of Significant Differences (ESD) that will pertain to all RODs except OU2. This evaluation is expected to be completed in the spring of 2011.

Risk-Based Cleanup Levels:

Surface Soils/Mine Waste:

Risk-based cleanup levels were identified in the OU1 ROD as well as subsequent documents related to remedial design. These risk-based cleanup levels include:

1. Arsenic - A cleanup level of 100 mg/Kg was established for residential land use only. This standard is generally still adequate to ensure protectiveness for public health and the environment. No arsenic cleanup level was established for other land uses including recreational, open space, commercial or industrial. Therefore, a cleanup level should be set for an exposure scenario involving arsenic and these land uses.

2. Lead - A cleanup level of 1,100 mg/Kg was established for residential land use and a cleanup level of 2,000 mg/Kg was established for open space, recreational and industrial lands. This standard is generally still adequate to ensure protectiveness for public health and the environment. No lead cleanup level was established for commercial land use

which is a plausible future land use at OU1. Therefore, a cleanup level should be set for an exposure scenario involving lead and this land use.

Review of existing cleanup levels and establishment of arsenic and lead cleanup levels for land uses discussed above will be documented in the ESD to be completed in the spring of 2011.

Other ARARs

Since no further response action was required under the 1998 ROD (unless redevelopment proposals are submitted), EPA did not list any federal or state ARARs under the ROD for continued remedial work.

All ARARs will be evaluated for the entire Kennecott Site during preparation of the ESD discussed above.

Question C: Has Any Other Information Come to Light that Could Call Into Question the Protectiveness of the Remedy?

No other information has come to light during the Five-Year Review that could call into question the current protectiveness of the remedy.

Technical Assessment Summary

According to the information collected and reviewed, the physical response actions are functioning as intended by decision documents. However, some inspection, maintenance, and land use control elements of the response actions are not functioning as intended by decision documents.

B.7. Issues

Based on information collected during this Five-Year Review Report, the following issues are identified in Table 2:

Table 2 - Issues for OU1

Item No.	Issues	Affects Current Protectiveness	Affects Future Protectiveness
1	Bingham Creek Channel annual inspection and reporting was not performed.	No	Yes
2	A maintenance and reporting program for Bingham Creek Channel response actions has not been developed or implemented.	No	Yes
3	Land use controls have not been implemented (including finalization and approval by EPA Region 8 and UDEQ) by West Jordan and South Jordan Cities and Salt Lake County.	No	Yes
4	A cleanup goal has not been identified at OU1 for arsenic under recreational, open space, commercial or industrial land uses or for lead under a commercial land use.	No	Yes
5	It is unclear what arsenic and lead cleanup levels were achieved at the residential properties addressed under the 1991 Action Memorandum (Phase I).	Yes	Yes
6	ARARs have not been reviewed as part of this Five-Year Review.	No	Yes

B.8. Recommendations and Follow-Up Actions

The recommendations and follow-up actions for the issues are summarized below in Table 3:

Table 3 - Recommendations and Follow-Up Actions for OU1

Item No.	Issues	Recommendations and Follow-up Actions	Party Responsible	Oversight Agency	Milestone Date	Affects Protectiveness (Y/N)	
						Current/	Future
1	Bingham Creek Channel annual inspection and reporting was not performed.	EPA will begin annual inspection of response actions in the channel and will prepare a report for the site files.	EPA	EPA/UDEQ	6/30/11	No	Yes
2	A maintenance and reporting program for Bingham Creek Channel response actions has not been developed or implemented.	EPA and UDEQ will coordinate with local authorities to define roles for this portion of the remedy.	EPA/UDEQ	EPA/UDEQ	6/30/11	No	Yes
3	Land use controls have not been formalized (including finalization and approval by EPA Region 8 and UDEQ) by West Jordan and South Jordan Cities and Salt Lake County.	EPA will provide the Cities and County with mapping showing the location of wastes remaining in-place. The Cities and County will develop, formalize and implement land use controls for OU1.	EPA/UDEQ	EPA/UDEQ	6/30/11	No	Yes
4	A cleanup goal has not been identified at OU1 for arsenic under recreational, open space, commercial or industrial land uses or for lead under a commercial land use.	Select appropriate cleanup levels and document in an ESD to be prepared for the entire Kennecott Site (except for OU2).	EPA/UDEQ	EPA/UDEQ	Spring 2011	No	Yes
5	It is unclear what arsenic and lead cleanup levels were achieved at the residential properties addressed under the 1991 Action Memorandum (Phase I).	Determine what arsenic and lead concentration standard the fifty properties under Phase I were remediated too.	EPA/UDEQ	EPA/UDEQ	12/31/10	Yes	Yes
6	ARARs have not been reviewed as part of this Five-Year Review.	Perform ARARs review and document in an ESD to be prepared for the entire Kennecott Site (except for OU2).	EPA/UDEQ	EPA/UDEQ	Spring 2011	No	Yes

B.9. Protectiveness Statement

A protectiveness determination of the remedy at OU1 cannot be made at this time until further information is obtained. Further information will be obtained by determining what arsenic and lead concentration standards the fifty properties under the Phase I residential removal action were remediated to. It is expected that this additional information will be obtained by December 31, 2010, at which time a protectiveness determination will be made. In order for the remedy to be protective in the long-term, land use controls and annual inspections and maintenance of certain response actions required by decision documents must be fully implemented.

B.10. Next Review

The Site requires ongoing Five-Year Review in accordance with CERCLA § 121 (c). The next five-year review for the Site will be performed no later than September 2015, five-years from the date of this review.

C. ANACONDA TAILINGS - OU5

C.1. Site Chronology

Table 4 summarizes the important events and relevant dates in the Site's chronology.

Table 4 - Chronology of Site Events

Date	Activity
Jan-93	UAO issued to ARCO, for EE/CA and removal (CERCLA VIII 93-06)
1997	Completion of response action
Sep-98	ROD
Dec-98	RD/RA Consent Decree with ARCO
1998-2003	Annual O&M reports submitted to EPA
Jun-04	First Five-Year Review.

C.2. Background

Location and Setting

Anaconda Tailings, also known as Copperton Tailings, ARCO Copperton Tailings and Utah-Apex Tailings, consists of approximately 3.5 million tons of lead, arsenic, zinc, and silver-bearing, fine grained sediments consolidated into a repository comprising 41 acres adjacent to Bingham Creek (See Map of OU5 in Appendix A). Land use is industrial/mining and since response actions have been completed, is used for open space. The nearest residential neighborhood is Copperton, about 3/4 mile away. The site is fenced and is not accessible to the general public.

Operable Unit 5 also includes Bastian Ditch which originates in the vicinity of Anaconda Tailings and roughly follows Utah Highway 111 southward nearly to the location of Butterfield Creek. The ditch is no longer in use. However, remnants can be seen along the south side of Anaconda Tailings and on Kennecott lands south of Anaconda Tailings. Current land use along the ditch is industrial and agricultural and the nearest residential neighborhood is Copperton, 3/4 mile away (at northern end of the ditch).

Site History and Extent of Contamination

Anaconda Tailings Impoundment:

Anaconda Tailings Site was originally a tailings pond constructed in 1914 to trap tailings produced by Utah Apex and Bingham New Haven Mills upstream in Bingham Canyon. Tailings were sluiced to the site via flumes. The pond allowed most tailings to settle out. Water, containing acids, heavy metals, and residual tailings, was then sent back to Bingham Creek or used by farmers for irrigation. Erosion, seepage and tailwaters from the tailings created contamination along Bingham Creek as well as in Bastian Ditch, discussed below.

There was approximately 1.3 to 1.5 million cubic yards of tailings present on the site. Average arsenic and lead concentrations were found to be 394 mg/Kg and 6,244 mg/Kg, respectively. Concentrations of lead at percent levels were found frequently at depth in the tailings.

Tailings showed some acid generating potential and evidence of some migration of metals in the acidic zone was found. However, deeper tailings samples showed neutralizing potential. During an investigation of the original tailing impoundment, subsurface soil and ground water provided no evidence of impacts to ground water from the site.

Ground water quality in the area is poor due to a sulfate and metals plume associated with upgradient sources. Groundwater is being addressed under a 2000 ROD.

Bastian Ditch:

The Bastian Ditch was constructed in the 1880's when water was diverted from Bingham Creek near the Oquirrh foothills to the Bastian Sink vicinity. The ditch conveyed irrigation waters to ranch and farm land south of Bingham Creek and ultimately carried water as far south as Copper Creek. The ditch captured tailings (originating from the Anaconda Tailings) that entered the creek upstream of the diversion. Ditch remnants could be seen along the south side of Anaconda Tailings and on Kennecott lands south of Anaconda Tailings.

Subsequent sampling showed scattered elevated lead values in the southern extension of the ditch system.

Baseline Risk Assessment

See Section B.2.

C.3. Response Actions

Decision Documents and Responsible Party

See Section B.3. for a general discussion of NPL status and enforcement history.

Tailings deposited in Bastian Ditch were removed by Kennecott and ARCO on their respective lands (west of Route 111) in accordance with decision documents under provisions of the following Orders:

- UAO, CERCLA VIII 93-06, January 15, 1993.
- AOC, CERCLA VIII 98-09, 1998.

Anaconda Tailings were consolidated and capped by ARCO in accordance with Decision Documents under provisions of the following Order:

- UAO, CERCLA VIII 93-06, January 15, 1993.

ARCOs obligations under the 1993 administrative order have been satisfied. Further, EPA and ARCO entered into a consent decree resolving ARCO's liability for the Bingham Creek Channel (OU 1); the Anaconda/ARCO Tailings (OU 5); and the Bastian Ditch and Bastian Sink (OU 17). See Consent Decree between the United States of America and Atlantic Richfield Company, Civil Action No. 2:95-cv-0698 entered by the U.S. District Court on December 16, 1999 ("ARCO CD").

There are no outstanding financial assurance issues.

A ROD was issued in 1998 for OU5 (as well as other OUs in the Kennecott South Zone). The ROD selected No Further Action. However, as discussed below in the Summary of Response Actions, O&M and other activities are required under Action Memoranda after the date of the ROD.

Summary of Response Actions

All response actions at OU5 were conducted as time critical removal actions and include.

Anaconda Tailings Impoundment:

- Consolidate tailings containing lead at or above a concentration of 2,000 mg/Kg from a 96-acre parcel on OU5 as well as soils excavated from ARCO projects along Bingham Creek to a repository on the western end of OU5. The repository is situated on 41 acres of the original 96 acre site.
- Cap consolidated mine wastes with a high-density polyethylene liner, clay, and vegetated soils.

- Install run-off and run-on controls, including a retention basin designed to withstand a 100-year storm event.

Bastian Ditch:

- Excavate mine wastes and either place them in the repository described above or transport to Bluewater Repository.

Operation, Maintenance, Monitoring and Reporting

ARCO agreed to perform long-term maintenance of the capped repository. There are upgradient and downgradient ground water monitoring wells to insure the cap is effective in prevention of leaching.

However, the requirement for five-years of ground water monitoring (under the 1993 UAO) was satisfied at the time of the first Five-Year Review. In addition, Salt Lake County agreed to use its authorities in land use planning, zoning, and building permits to insure cap integrity is not compromised.

The Site inspection (Section C.5.) indicated that maintenance of the capped facility is occurring. However, the lack of reporting requirements precludes any document review associated with cap maintenance.

C.4. Progress Since Last Five-Year Review

The First Five-Year Review included the following protectiveness statement:

> *"The remedy at OU5 is currently protective of human health and the environment and exposure pathways that could result in unacceptable risks are being controlled."*

No issues were identified in the first Five-Year Review requiring resolution.

Since the first Five-Year Review, ARCO has been conducting regular inspections of response action features in OU5. However, no reporting has been performed.

C.5. Five-Year Review Process

Administrative Components and Community Notification and Involvement

See Section B.5.

Document Review

- Action Memorandum for a Time-Critical Removal Action at the ARCO Tailings Site, Salt Lake County, Utah. August 5, 1993.

Also see Section B.5.

Data Review

No analytical or other data relevant to this Five-Year Review was collected during the review period.

Site Inspection

Two Site Inspections were performed on July 25, and November 18, 2009, by the following personnel:

- Rebecca Thomas, EPA Remedial Project Manager
- Doug Bacon, UDEQ Remedial Project Manager
- Dave Allison, UDEQ Community Relations
- Brian Vinton, North American Mine Services Inc.(contractor to Kennecott Utah Copper)
- Steve Anderson, Anderson Engineering (contractor to ARCO)

The Site inspection of OU5 was limited due to inaccessibility of the capped repository (locked gate), which was observed from a distance. Therefore, Doug Bacon of UDEQ conducted a more thorough inspection of OU5 on November 18, 2009. The purpose of the inspection was to visually verify stability of the repository cap, successful growth of vegetation, and condition of run-on/run-off controls.

The inspection revealed that the repository and cap are stable. There were no visible gullies or erosional cuts in the cap surface. Photographs of the repository taken on July 25 and November 18, 2009 are provided as Photo Nos. 11-26 in Appendix B. There were a few minor gopher holes located along the southern repository boundary just east of the run-off control ditch. Depth of gopher holes could not be determined, but no visible tailings were seen. Vegetative cover on the repository cap is primarily grasses, with a few rabbit brush or sage plants.

Run-off control ditches (surrounding the repository) were vegetated and showed very little signs of use. Precipitation that percolates through the soil cover and to the gravel drainage blanket above the repository clay layer is directed towards drainage ditches. Water then is directed to a sediment basin designed to withstand the maximum flood event for this area. The sediment basin, its emergency overflow channel and drainage pipe were all in good condition.

Although the July 25th Site Inspection was limited, one feature of interest was noted. A one-acre pile of consolidated and uncapped wastes was present at the toe of Large Bingham Reservoir dam. Concentrations of arsenic and lead at the surface of this pile reportedly are not known. This feature is identified on a Map of OU5 presented in Appendix A and in Photo No. 27 in Appendix B.

C.6. Technical Assessment

Question A: Is the Remedy Functioning as Intended by the Decision Documents?

No, the remedy is not functioning as intended by the decision documents.

Site decision documents include:

- 1993 Action Memorandum
- 1998 OU1 ROD

Remedy elements identified in decision documents are summarized below. An assessment of remedy element functionality is also provided.

1. Condition of Response Action

   Based on the results of the Site Inspection, the cap and surface water control features are in good condition. Therefore, this remedy element is functioning as intended.

   The suspected uncharacterized one-acre area of consolidated material just east of the Large Bingham Reservoir Dam is of potential concern. Although the site is currently secured, knowledge of chemical concentrations at the surface would be helpful during development of land use controls discussed below.

2. Land Use Controls

   Based on information summarized in Section C.3., land use controls on OU5 are the responsibility of Salt Lake County.

   Although documents reviewed for this report indicate the County has accepted responsibility, interviews with County officials indicate that land use controls have not been formalized and are not fully implemented. It is also likely the County does not possess accurate mapping to show locations of waste remaining in-place. Therefore, this remedy element is not functioning as intended by decision documents.

Question B: Are the Exposure Assumptions, Toxicity Data, Cleanup Levels, and Remedial Action Objectives (RAOs) Used at the Time of the Remedy Selection Still Valid?

Human Health:

Changes in Exposure Pathways:

These have been no changes in land use or potentially exposed populations. Therefore, there have no changes in exposure pathways.

Changes in Toxicity, and Other Contaminant Characteristics:

There have been no changes in toxicity factors or characteristics for COCs that were used to develop cleanup levels.

Changes in Risk Assessment Methods:

There has been no change to standardized methodology that could affect protectiveness of the response action.

Expected Progress Towards Meeting RAOs:

Because past removal actions were designed to achieve final remedial cleanup goals, no further action was selected as the remedy for OU5 and no RAOs were identified.

Ecological Assessment:

EPA concluded in the OU1 ROD that there are no actual or threatened releases from OU5 (as well as OU 1, 4, 10, 11 and 17) that pose a present or potential future threat to the environment. Therefore, ecological impacts were not considered further in this Five-Year Review.

Cleanup Levels:

ARAR-Based Cleanup Levels:

Site cleanup levels are risk-based concentrations. However, all ARARs including any potential ARAR-based cleanup levels will be evaluated for the entire Kennecott Site as part of the development of an ESD that will pertain to all RODs except OU2. This evaluation is expected to be completed in the spring of 2011.

Risk-Based Cleanup Levels:

Surface Soils/Mine Waste:

The 1993 Action Memorandum identified 2,000 mg/Kg lead as the concentration above which mine wastes at OU5 were consolidated and capped. The 1998 ROD recognized this concentration as protective for open space, recreational and industrial land uses.

Given that there have been no changes to exposure pathways, toxicity or risk assessment methods that would affect calculation of a lead cleanup goal, this standard is generally still adequate to ensure protectiveness for public health and the environment under recreational, open space and industrial land uses.

No arsenic cleanup level was established for OU5. Therefore, a cleanup level should be set for arsenic under recreational, open space and industrial land uses. Review of existing cleanup levels and establishment of an arsenic cleanup level for recreational use will be documented in the ESD discussed above.

Other ARARs:

Since no further response action was required under the 1998 ROD (unless redevelopment proposals are submitted), EPA Region 8 did not list any federal or state ARARs under the ROD for continued remedial work.

All ARARs will be evaluated for the entire Kennecott Site during preparation of the ESD discussed above.

Question C: Has Any Other Information Come to Light that Could Call Into Question the Protectiveness of the Remedy?

It is suspected that portions of Bastian Ditch containing tailings deposits were not subjected to response actions. These may include, but are not limited to:

- Where Route 111 crosses the ditch
- Where the ditch crosses the Trans-Jordan Landfill
- Segments south of 11800 South

These and other segments of the ditch are candidates for ICs that would include land use controls to minimize the possibility of unacceptable human exposure to COCs.

No other information has come to light during the Five-Year Review that could call into question current protectiveness of the remedy.

Technical Assessment Summary

According to information collected and reviewed, physical response actions are functioning as intended by decision documents. However, land use control portions of response actions are not functioning as intended by decision documents. In addition, ARCO is not required to provide reports of their operation, monitoring and maintenance activities for the cap at their repository. Reporting (including reports on cap stability) is necessary to demonstrate and document that such activities are occurring between Five-Year Reviews.

C.7. Issues

Based on the information collected during this Five-Year Review Report, the following issues are identified in Table 5:

Table 5 - Issues for OU5

Item No.	Issues	Affects Current Protectiveness	Affects Future Protectiveness
1	Land use controls have not been implemented by Salt Lake County. In addition, reporting on land use control performance was not required but is necessary to ensure that ICs are functioning.	No	Yes
2	A one acre sized uncapped/uncovered waste pile is present at the toe of the Large Bingham Reservoir dam. Arsenic and lead concentrations at the surface of this feature are unknown.	No	Yes
3	ARCO is not required to provide reports of their operation, monitoring and maintenance activities for the cap at their repository. Reporting is necessary to demonstrate and document that such activities are occurring between Five-Year Reviews.	No	Yes
4	Segments of the Bastian Ditch may still contain tailings.	No	Yes
5	A cleanup goal has not been identified at OU5 for arsenic under recreational, open space, commercial or industrial land uses.	No	Yes
6	ARARs have not been reviewed as part of this Five-Year Review.	No	Yes

C.8. Recommendations and Follow-Up Actions

The recommendations and follow-up actions for the issues are summarized below in Table 6:

Table 6 - Recommendations and Follow-Up Actions for OU5

Item No.	Issues	Recommendations and Follow-up Actions	Party Responsible	Oversight Agency	Milestone Date	Affects Protectiveness (Y/N)	
						Current/	Future
1	Land use controls have not been implemented by Salt Lake County. In addition, reporting on land use control performance was not required but is necessary to ensure that ICs are functioning.	Develop, formalize and implement land use controls for OU5 and report on their implementation and functionality.	EPA/UDEQ	EPA/UDEQ	6/30/11	No	Yes
2	A one acre sized uncapped/uncovered waste pile is present at the toe of the Large Bingham Reservoir dam. Arsenic and lead concentrations at the surface of this feature are unknown.	Develop a land use restriction.	ARCO	EPA/UDEQ	6/30/11	No	Yes
3	ARCO is not required to provide reports of their operation, monitoring and maintenance activities for the cap at their repository. Reporting is necessary to demonstrate and document that such activities are occurring between Five-Year Reviews.	UDEQ will perform annual inspections and will document the condition of the remedy.	UDEQ/ARCO	EPA/UDEQ	12/31/10	No	Yes
4	Segments of the Bastian Ditch may still contain tailings.	Develop a land use restriction.	EPA/UDEQ	EPA/UDEQ	6/30/11	No	Yes
5	A cleanup goal has not been identified at OU5 for arsenic under recreational, open space, commercial or industrial land uses.	Select appropriate cleanup levels and document in an ESD to be prepared for the entire Kennecott Site (except for OU2).	EPA/UDEQ	EPA/UDEQ	Spring 2011	No	Yes
6	ARARs have not been reviewed as part of this Five-Year Review.	Perform ARARs review and document in an ESD to be prepared for the entire Kennecott Site (except for OU2).	EPA/UDEQ	EPA/UDEQ	Spring 2011	No	Yes

C.9. Protectiveness Statement(s)

The remedy at OU5 currently protects human health and the environment through actions that isolate contaminants. However, in order for the remedy to be protective in the long-term, land use controls must be fully implemented.

C.10. Next Review

The Site requires ongoing Five-Year Review in accordance with CERCLA § 121 (c). The next five-year review for the Site will be performed by September 2015, five-years from the date of this review.

D. OTHER OPERABLE UNITS

The following sections of this report provide a brief discussion of the status of OUs 4, 10, and 11.

D.1. Large Bingham Reservoir - OU4

The current Large Bingham Reservoir replaced leaking and unlined reservoirs retired in 1991(See Map of OU4 in Appendix A). The exiting facility is triple lined and impounds storm water and mineral extraction process water and other waters managed by Kennecott Utah Copper in the South Zone. The performance of this facility is monitored through a Utah Ground water Permit (UGW 350006). Permit compliance involves meeting hydraulic head limitations in the reservoirs as well as ground water quality as measured in downgradient monitoring wells. Permit compliance is the only performance measure for OU4.

Based on a December 2, 2009, email from Dan Hall of UDEQ Division of Water Quality, Kennecott is in compliance with UGW 350006 for the Large and Small reservoirs of Bingham Canyon. The permit is up for renewal at the end of 2010.

D.2. Copperton Soils - OU10

Historical photographs revealed that the eastern end of the town of Copperton was constructed on a tailings deposit (See Map of OU10 in Appendix A). However, the 1998 ROD explained that the concentrations of hazardous substances were low and well beneath action levels for residential property.

Therefore, conditions at this OU allow for unrestricted use and no further five-year reviews of this OU are required.

D.3. Bingham Canyon - OU11

The Bingham Canyon OU consists of multiple historic mining sites located within the active Kennecott mine operation (See Map of OU11 in Appendix A). Some of these historic mine sites were at one time considered candidates for active cleanup. However, since the first Five-Year Review in 2004, all but three of the inventoried historic mining sites have been buried or subsumed by the open pit of the active mine operation. A report entitled "Oquirrh Mountain Mining and the Environment" by Dr. Eva Hoffman of USEPA (2005), provides the following site descriptions

The Yellow Cake Plant (facility ID #83) was located on property owned by Energy Fuels in the 1980s (until the property was acquired by Kennecott Utah Copper). The process was a uranium recovery plant that treated effluent from Kennecott's Precipitation Plant with an ion-exchange circuit. The plant was closed in 1989. In the early 90's Kennecott instructed the operator to remove everything from the property. The cleanup was performed by Energy Fuels Nuclear Inc., supervised by UDEQ's Division of Radiation Control and observed by Kennecott.

As noted in the 2005 report, the site is suitable for unrestricted land use and currently is the location for a materials storehouse operated by Kennecott.

The Lead Mine Mill (facility ID #1) was built in 1883 and operated until it burned in 1896. The milling process included the grinding and crushing of lead, silver and gold ores. A pyretic smelter was then erected at the site and operated until 1901. Kennecott reported to EPA that during operations the mill processed 70,000 tons of lead, silver and gold ore leaving approximately 46,667 tons of tailings containing at least 1400 tons of lead (Kennecott 104e, 1991). Due to the site being buried under the Precipitation Plant site, the site was closed out in the Bingham Creek ROD. The Lead Mine Mill will fall under the scope of the characterization and land use controls development actions being pursued by Kennecott at the Precipitation Plant site (OU24). Kennecott Utah Copper intends to negotiate land use controls (through an environmental covenant) with the Agencies under the pending North Zone & South Zone Consent Decree.

The C.W.Watson's Jig (facility ID #40.14) was located in the vicinity of the current Kennecott Utah Copper Precipitation Plant. The jig was used to collect placer gold in Bingham Creek Canyon in the early 1890s. The water and probable feed used by the jig was flumed from a tunnel (Watson) located 2,000 feet up gradient in Bingham Creek Canyon. In 1903 the site was used by Utah Copper Company for tailings storage. The Bingham Creek ROD gave the site a No Further Action status from CERCLA response action because of the site's inaccessibility or non-existence. The site does exist but is only accessible to mine workers.

The forthcoming ESD will evaluate the status of all historic features.

Appendix B - Site Photographs

Photo No.1 – Lush vegetation on banks of Bingham Creek (OU1) approximately 1 mile upstream of confluence with Jordan River. View to East.

Photo No.2 – Bingham Creek channel 1300 West, view to the west.

Photo No.3 – Bingham Creek channel 1300 West, view to the east.

Photo No.4 – Bingham Creek channel 2200 West, view to the east.

Photo No.5 – Bingham Creek channel 2700 West, view to east.

Photo No.6 – Bingham Creek channel near 2700 West, view to the west.

Photo No.7 – Bingham Creek channel 2700 West, view to the east.

Photo No.8 – View of north bank of Bingham Creek (OU1) at 4000 West. View to West.

Photo No.9 – Bingham Creek channel just 4400 West, view to the east.

Photo No.10 – Bingham Creek channel near 4400 West, view to the west.

Photo No. 11 –Bingham Creek Channel located north of OU5 and east of OU4 (Kennecott's Large Bingham Reservoir). This section of the Creek depicts conditions in the channel from OU5 to about 4000 West.

Photo No.12 – ARCO Tailings Repository (OU5). View to South.

Photo No.13 – ARCO Tailings Repository (OU5). View to Southeast.

Photo No.14 –Panoramic view of the eastern end of OU5. In the foreground is the run-on/run-off sedimentation basin and in the distance are the Oquirrh Mountains. The photo was taken from the emergency spill way of the basin looking west toward the OU5 tailings repository.

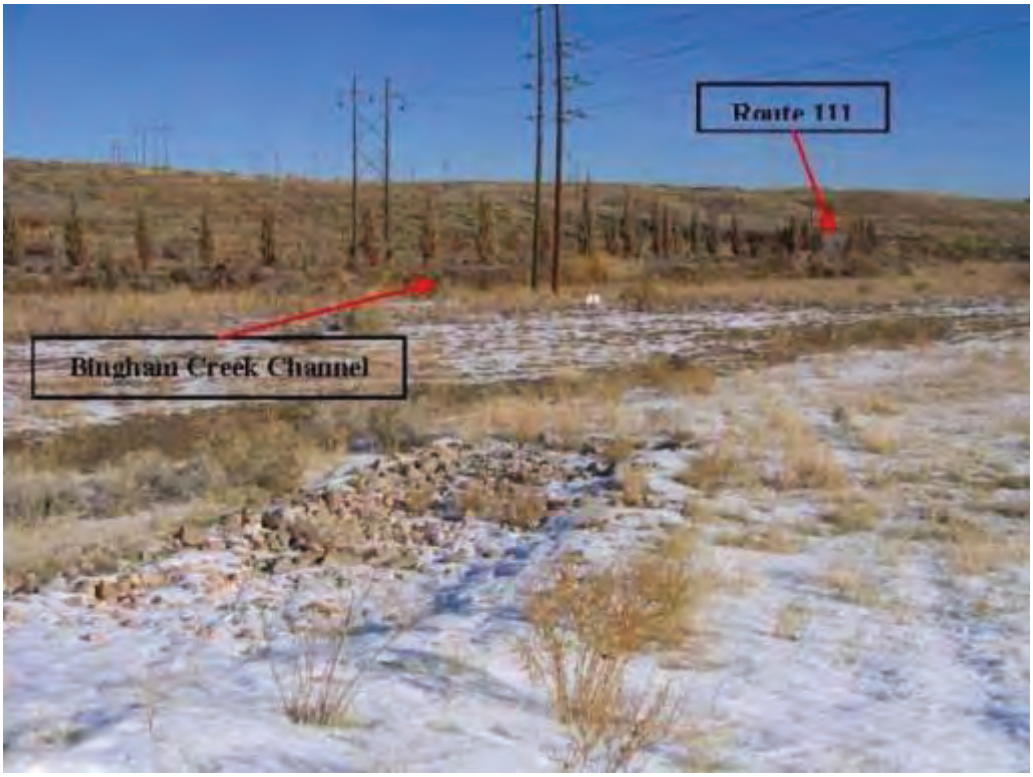

Photo No.15 - Spillway release channel (rip-rap) leading from the sedimentation towards the modern day channel of Bingham Creek. Route 111 is in the distance through the access road to Progressive Nursery.

Photo No.16 – Top of the emergency spillway of the sedimentation basin of OU5, and along the northern embankment (in the near distance) is the vertical drainage pipe.

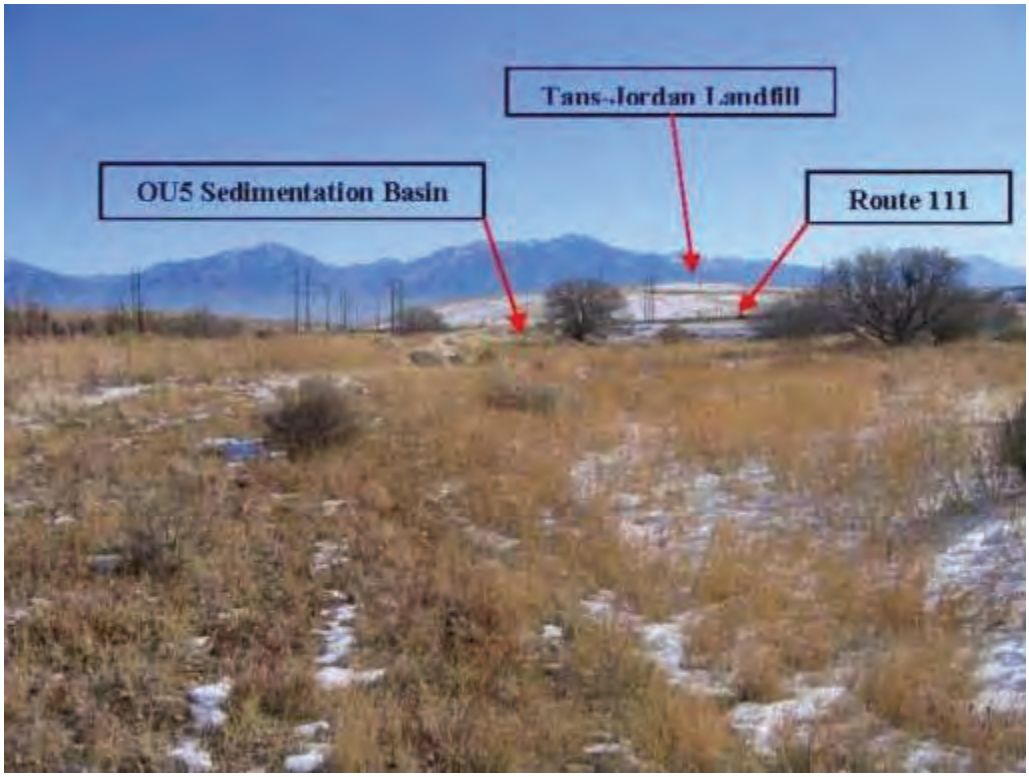

Photo No.17 – Northern run-off ditch used to direct precipitation from the repository to the sedimentation basin. .

Photo No.18 – Top and east slope of repository. The top of the repository is sloped to the south/southeast. The slope was stable, with very little erosional activity along it.

Photo No.19 – Monitoring wells, completed at different depths. These wells are located approximately at the northeast corner of the tailings repository at OU5.

Photo No.20 –Run-off control ditch that runs parallel to the southern boundary of the repository.

Photo No.21 – Southern run-off ditch as it straightens and heads north to connect to the north run-off ditch. This ditch is underlain by HDPE liner with rip-rap over the top.

Photo No.22 –Top surface of the tailings repository at OU5 (near the center of the approximate 41 acre repository).

Photo No. 23 – Top surface of the tailings repository (looking west). The photo was taken to document the planting rows still visible from the revegetation efforts in 1997. 12 years have expired since the revegetation effort and these rows help to document the stability of the cap on the repository.

Photo No. 24 – Northern embankment of the tailings repository at OU5 (view is to the west toward Bingham Canyon). Visible are some of the planting rows along the surface of the embankment.

Photo No. 25 –Northern embankment of the tailings repository at OU5 (view is to east). Though this slope appears not to be well vegetated, in the spring low lying grasses spring up with new growth.

Photo No. 26 - Northern embankment of the tailings repository at OU5 viewed from the northwest corner.

Photo No. 27 – Located on land whose ownership is not known currently (due east of Kennecott's Large Bingham Reservoir Zone 2 Dam) are piles of mixed soils with unknown characteristics. The land is about 1 acre in size and is within Kennecott secured property. The location of this feature is illustrated on a map provided in Appendix A.

Photo No. 28 - Area of the repaired erosional cut along Rt. 111 as it is today.

Photo No. 29 - Area of the buried drainage pipe leading off to Bingham Creek Channel (after Repair).

Photo No. 30 – View up Bingham Canyon illustrating the extent of encroachment of mine waste deposits. All historic facilities in this are (OU11) have been buried by mine waste deposits. View to West.

November 19, 2009

BINGHAM CREEK FIVE-YEAR REVIEW QUESTIONS

1) What is your current knowledge of the Bingham Creek cleanup actions? The Utah Department of Transportation said its discovery and Phase I process located areas of concern while coordinating with local agencies during planning of the Mountain View Corridor freeway system. The Mountain View Corridor freeway system is located in western Salt Lake and northwestern Utah County traveling across an upper section of the Bingham Creek cleanup area. The Mountain View corridor will service 13 municipalities and will begin construction in late spring/early summer of 2010 on a 15-mile segment between 5400 South and Redwood Road (at approximately 16000 South).

To ensure construction activities do not interfere with communities, UDOT follows guidelines in accordance with the National Environmental Policy Act (NEPA). UDOT said UDEQ and EPA have reviewed the Environmental Impact Statements (EIS) during planning stages. Air quality was the primary environmental topic of concern.

2) Are there any concerns UDOT has regarding long term protectiveness of the remedy for properties where soils with elevated contaminants of concern (COCs) were left in place either at depth or at the surface? UDOT officials did not have any health or environmental concerns as construction plans will occur in a phased approach and will not involve subsurface digging into capped areas for some time (Phase I). UDOT will construct one lane frontage roads on top of capped areas where the freeway will eventually be built. Construction activities within areas of the Bingham Creek would not take place until Phase II when the freeway is constructed and pylons are buried for support. Any excavation requires permits and triggers mechanisms (in-house) to address any subsurface soil contamination in the future.

At this time, UDOT did not foresee any construction scenario which would require removal and disposal of large amounts of contaminated soil. UDOT said they would coordinate all activities with UDEQ and EPA as necessary. There is a 20–year completion schedule depending on how quickly funds are available. Also, all required safety and management plans (developed in house) are observed to protect workers onsite and surrounding communities.

3) Do you have any additional comments, suggestions or questions regarding the clean up? No additional comments were provided and contact information was exchanged for future dialogue and questions regarding the Bingham Creek cleanup areas.

Interviews conducted by Dave Allison and Doug Bacon, UDEQ.

BINGHAM CREEK FIVE-YEAR REVIEW QUESTIONS

1) What is your current knowledge of the Bingham Creek (OU1) cleanup actions? South Jordan is aware of cleanup occurring in the upper portions of the Bingham Creek west of the City in undeveloped portions of South Jordan. Despite growing development interest in South Jordan there is no development plans in or near the Bingham Creek cleanup areas other than: 1) a proposed trail system near 4500 West and 9600 South, a location south of the Bingham Creek corridor, and 2) Mountain View Corridor, a UDOT road project. South Jordan wants to coordinate and link its trail system with one planned for the Daybreak area by Kennecott Land in the future.

2) Are there any concerns South Jordan City has regarding long term protectiveness of the remedy for properties where soils with elevated contaminants of concern (COCs) were left in place either at depth or at the surface? South Jordan did not have any health or environmental concerns as cleanup areas were located in undeveloped areas of the City. Also the city is not planning any immediate development near the Bingham Creek cleanup locations and no community concerns were ever raised over the last five years.

South Jordan does not have a formal Institutional Control process or reporting mechanism in place since the cleanup occurred in undeveloped areas. South Jordan said any development precautions would fall within the South Jordan building permit process. A hazardous Geologic Map is in development by the city Engineering Department to track any sensitive land areas in South Jordan for the future.

There are projects the City watches closely (but is not necessarily involved with) which may impact the Bingham Creek remedy areas. As noted above under #1, a major highway, the Mountain View Corridor, is planned for the west side of the Salt Lake Valley and within city limits of South Jordan which crosses the Bingham Creek Channel. Also the UTA Light Rail extension is in development which could impact areas of cleanup.

3) Do you have any knowledge of any actions or events that may have caused for a reduction of the protectiveness of the remedy? South Jordan has heard in stakeholder meetings the County and Kennecott Land have plans for an extensive park and trails system along the Bingham Creek Channel corridor in the near future. South Jordan expects the cleanup areas would be accounted for during development and consideration

made to trail and park locations in coordination with known soil characteristics in the Channel.

4) Do you have any additional comments, suggestions or questions regarding the clean up? South Jordan would appreciate more open dialogue with Kennecott Land and Salt Lake County concerning information on the status of parks and trails. South Jordan City would also like more information on areas that were cleaned up.

Interviews conducted by Dave Allison and Doug Bacon, UDEQ.

BINGHAM CREEK FIVE-YEAR REVIEW QUESTIONS

1) What is your current knowledge of the Bingham Creek (OU1) cleanup actions? With the cleanup completed in 1999, West Jordan's primary role over the last five years was focus on maintaining the integrity of the cleanup areas. West Jordan City was involved with Phase I and II of the cleanup and the majority of residential properties. West Jordan is currently growing and experiencing development interest and has transportation light rail construction ongoing within areas of the Bingham Creek operable unit. Though noted was development interest, the City was not aware of any large development projects since the last five years within the site. The Engineering Department has experienced members on staff who worked on the cleanup with institutional knowledge of the cleanup activities.

2) Do you have any *personal* concerns regarding the clean up? Are you aware of any *community* concerns? No one expressed any health or environmental concerns from the cleanup. The City only receives a rare community inquiry with property or home transactions. The City is confident cleanup areas are well documented and development procedures are place (though not formally accepted by the Agencies) to maintain the remedy.

3) Are there any concerns West Jordan City has regarding long term protectiveness of the remedy for properties where soils with elevated contaminants of concern (COCs) were left in place either at depth or at the surface? Anyone developing or utility work occurring within sensitive areas is coordinated via permits through the City of West Jordan's engineering department. West Jordan City expressed a need to work with EPA and UDEQ to approve their Institutional Control ordinances and program. West Jordan is confident the building review process and requirements for testing (if necessary) are universally applied for all proposed developments. West Jordan has developed a GIS overlay map with a residential grid to keep track of the properties that were originally cleaned up.

4) Did West Jordan adopt an Institutional Controls Plan the City had drafted and if so, please explain how the plan continues to be implemented? West Jordan has documented the cleanup areas and instituted a soils ordinance a year ago to deal with cleanup areas. West Jordan's soil ordinance requires developers to enlist in the Utah Department of Environmental Quality's (UDEQ) Voluntary Cleanup Program (VCP). However, a revised ordinance has yet to be approved by the City's Planning and Zoning

Commission as well as UDEQ and EPA. West Jordan felt this could be done quickly as draft language is developed just not formally approved.

5) Do you have any knowledge of any actions or events that may have caused for a reduction of the protectiveness of the remedy? The only area of concern for the city is the Utah Transportation Authority (UTA) Light Rail project for West Jordan. Consistent coordination is required within the cleanup zone and the City is reliant upon timely reporting from UTA. West Jordan assumes UDEQ oversight is involved with the UTA to prevent a release or note any soil disposal actions.

6) Does West Jordan City have records on their maintenance activities for the area?

West Jordan said they have all of the closure remediation reports associated with the cleanup available to the public as well as residential property clean letters on file.

7) Do you have any additional comments, suggestions or questions regarding the clean up? No additional comments other than scheduling future meetings with EPA and UDEQ to finalize language for their soil ordinance plan.

8) Does West Jordan City know of anyone else that the Agencies should interview? West Jordan suggested coordinating with Salt Lake County and also could provide some residential contacts for interviews**.**

Interviews conducted by Dave Allison and Doug Bacon, UDEQ.

Steve Anderson, Anderson Engineering (ARCO's Contractor)
Chuck Stillwell, ARCO
Utah Department of Environmental Quality
168 North 1950 West
Salt Lake City, Utah 84116

August 6, 2009

BINGHAM CREEK FIVE-YEAR REVIEW QUESTIONS

1) What is your current knowledge of the Bingham Creek (OU1) and Anaconda Tailings (OU5) cleanup actions? Anderson Engineering was contracted by the Atlantic Richfield Company (ARCO) to address portions of the cleanup of Operable Units (OU) 1 and all of OU5. ARCO's work in Bingham Creek Phase III included approximately 76 properties in the Jordan View Estates, Meadow Green, Fahnian Ranchettes, Vista West, Sugar Factory, and Brookside areas. ARCO was also involved with portions of the Bingham Creek Channel cleanup work (Bingham Creek Phase II and lower Bingham Creek). OU5 involved the Anaconda (ARCO) Tailings repository located adjacent to Bingham Creek. ARCO still has the responsibility to perform long-term maintenance of the capped repository.

Removal Actions were conducted in 1995 by ARCO to address the problems associated with mining wastes beginning with the streambed channels of Bingham Creek and over flow areas. ARCO cleaned up the streambed to 2500 ppm lead soils and came back in following years to do some repair and energy reduction work to avoid erosion.

Chuck Stillwell, ARCO Project Manager, and Steve Anderson of Anderson Engineering, were on hand for all of the removal work at OU1 and OU5. As residential properties became the focus, ARCO removed all soils above 1100 ppm lead and 100 ppm arsenic, down to 18-inches in depth with clean top soil on approximately 76 properties.

2) Do you have or know of any community concerns? Anderson said the project went smoothly, with no difficulties and nothing has changed the remedy. The only recent follow up activities include maintenance of the capped repository located in OU5 and monitoring inspections. Mr. Anderson and Mr. Stillwell were not aware of evidence documenting negative impacts to the protectiveness of the remedial action at this time. Recently the community has not presented or discussed with either ARCO or Anderson Engineering any health or environmental concerns. A year after the cleanup was completed Anderson received an occasional call regarding property transactions and provided (upon request) data from the previous sampling program. No Further Action/Clean Letters were provided to every property owner whose property was cleaned up to the prescribed remedy.

3) In your opinion, do you have any knowledge of actions or events that may have caused for a reduction of the protectiveness of the remedy? Other than some minor repair work in some areas a few years ago no reason has risen to suspect the remedy is

not functioning at OU1. As for OU-5, ARCO knows of no events causing maintenance issues at the capped repository and associated migration controls. Mr. Anderson mentioned he was aware of recent construction work near the 9000 South portion of the Bingham Creek streambed by the Utah Department of Transportation (UDOT) and was curious if the Agencies or local communities were involved in overseeing their work. The UDOT project was the only activity Mr. Anderson knew of that might excavate into buried impacted soils in OU1.

4) Was ARCO or its contractor(s) involved with the discussions concerning long term protectiveness of the remedy, for properties where soils with elevated contaminants of concern (COCs) were left in place either at depth or at the surface? Mr. Anderson said discussions were coordinated with the regulators and Salt Lake County Flood Control, no specific policies were established. Mr. Anderson also noted he has only been called twice concerning properties that were not sampled in OU1 and wondered if the local communities would require developers to address potentially impacted soils. Mr. Anderson stated 11 volumes of post removal, closure, and O&M inspection reports were provided to West Jordan and Salt Lake County to detail cleanup specifications that would be useful for developing Institutional Controls. As the responsibility for maintaining the remedy in OU1 was apparently passed to the County and local communities, Mr. Anderson really could not comment on what level of involvement occurs by local jurisdictions when redevelopment takes place in the post-remedy cleanup areas of OU1.

5) Do you have any additional comments, suggestions, or questions regarding the cleanup work? Mr. Anderson and Mr. Stillwell thought speaking with Salt Lake County would help with ensuring that the remedy in OU1 is protected and that the County still has existing documentation on the remedies for both OU1 & OU5. No other comments were provided.

Interviews conducted by Dave Allison and Doug Bacon, UDEQ.

Piper Rhodes, Sr. Environmental Specialist – Kennecott Land
Ben Franciscotti, Manager Community Construction - Kennecott Land
Ehud Ardon, North American Mine Services (Kennecott Land Contractor)
Jeff Haws, Landscape Planner/Architect - Kennecott Land
Kennecott Land Company
4700 Daybreak Parkway
South Jordan, Utah 84095
Tel: 801-204-2000

Questions -

1) Is Kennecott Land aware that the sections of Bingham Creek within the Daybreak property were cleaned up to the established commercial land use standard established by EPA for the removal action (2000 mg/kg lead)? With a long history of Kennecott reclamation in the area, Kennecott Land by necessity, is aware and coordinates all development/construction within the company to handle areas of previous cleanups that are under redevelopment.

2) What are Kennecott Land's current development plans for the Bingham Creek corridor? Kennecott Land officials have future plans for a park, ball fields, and trail system within areas near the Bingham Creek channel. The plans are three years out or more as financing becomes available. Kennecott Land does not intend to undertake any other redevelopment of the Bingham Creek corridor that would be beyond a commercial/park type land use. Kennecott Land is working with the city of South Jordan and Salt Lake County on future plans to coordinate linking respective trail systems.

3) Does Kennecott Land have data documenting metals concentrations potentially above what may be appropriate for the intended land use? Kennecott Land has all pertinent data from Kennecott Utah Copper and makes the data available online for their project managers.

4) Is Kennecott Land coordinating with the local jurisdiction on the redevelopment plan for the Bingham Creek corridor? Presentations were made to South Jordan and West Jordan cities as well as at stakeholder meetings to communicate development activities by Kennecott Land.

5) Is Kennecott Land intending to complete acquisition of the UP freight line west of 5600 West and paralleling the north boundary of Daybreak within the area of the Daybreak Commerce Park? If so, will Kennecott Land be pursuing a removal of the rail and the rail bedding material after acquisition? At this time, no determinations have been made by Kennecott Land regarding the removal of the railway. However, any soil removal would be performed under an approved work plan with oversight by the Agencies (EPA & UDEQ). Coordination with other local jurisdictions and interested stakeholders would also take place prior to implementing said work plan.

8) If Kennecott Land is intending to develop the Bingham Creek corridor as a park or recreational area, what long term institutional controls (if any) does Kennecott

Land foresee being needed to ensure that this land use remains in place? Kennecott Land expressed a corporate philosophy of eliminating any restrictions on property and wants to avoid Institutional Controls. That said, any redevelopment would need to ensure that soils comply with the Agencies' accepted residential land use standards for lead and arsenic, for the Daybreak Community. Any remediation efforts would address soils above the residential land use standards. Kennecott Land said cooperation with local authorities, county, city and regulatory agencies can expedite information exchange necessary to ensure continuous dialogue so all are informed about remedial activities.

9) Do you have any additional comments, suggestions or questions regarding the clean up? Kennecott Land said they would check with South Jordan City to make sure they were aware of future park and trail plans and any remediation work performed by Kennecott Land would be coordinated with Kennecott Utah Copper's Environmental Division, as well with UDEQ and EPA.

Interviews conducted by Dave Allison and Doug Bacon, UDEQ.

December 10, 2009

BINGHAM CREEK FIVE-YEAR REVIEW QUESTIONS

1) What is your current knowledge of the Bingham Creek (OU1) cleanup actions? Salt Lake County (SLCO) officials from the Planning and Engineering Departments said they were aware of the Bingham Creek cleanup activity, primarily through the Flood Control Dept. and coordination efforts during the years of remediation. SLCO said any issues regarding the Bingham Creek cleanup areas are usually referred to UDEQ or EPA with the expectation that these agencies are the appropriate authorities with detailed information on the cleanup areas.

2) Do you have any *personal* concerns regarding the clean up? Are you aware of any *community* concerns? No one representing the various divisions of SLCO expressed any health or environmental concerns regarding the cleanup and no issues have occurred over the last five years from the community. However, internal coordination as it pertains to documentation on the past removal/remedial actions, at SLCO and the regulating entities is becoming more important. SLCO officials feel development pressures along the West Bench of the Salt Lake Valley could impact remediated areas if not managed in detail.

SLCO officials said through staff turnover and time, only a general knowledge of cleanup actions exists with the long term employees of the individual departments. SLCO currently relies on UDEQ and EPA oversight when their customers have questions or seek development approval. SLCO wishes to incorporate the cleanup history (where appropriate) to make planning, engineering and land management decisions for this area under their existing authorities.

No one at SLCO wants any mistakes due to a lack of documentation. Establishing both an institutional controls program and the necessary document repository would require some internal research, sharing, and coordination of departmental information. How the cleanup areas are documented (as an information source at SLCO) and who addresses within the planning, development, and engineering departments during redevelopment proposals, needs clarification at SLCO.

3) Are there any concerns SLCO has regarding long term protectiveness of the remedy for properties where soils with elevated contaminants of concern (COCs) were left in place either at depth or at the surface? No situations have come up to date as far as SLCO knows. SLCO understands that (where applicable based on jurisdiction) local cities generally use their building permit or ordinances to control development actions within OU1 Bingham Creek. SLCO expressed a need to work with EPA and UDEQ to develop and approve institutional control ordinances similar to what the cities have in place or are developing. SLCO wants to develop a GIS overlay map with a residential grid to keep track of the cleanup areas (both residential properties and undeveloped segments on Bingham Creek).

4) Did SLCO adopt an Institutional Controls Plan and if so, please explain how the plan continues is implemented? Nothing is implemented to date although the SLCO emphasized an intention to do so, to address recent development issues in the West Bench areas of the Salt Lake Valley. SLCO says they currently require seismic evaluations on properties and could easily require land management tools to address development along Bingham Creek.

The SLCO District Attorney worked on the Bingham Creek cleanup from the beginning, has detailed knowledge of the existing protective requirements, and was involved with discussions for institutional controls with Kennecott, EPA and UDEQ years ago. SLCO did not see any reason discussions couldn't begin as early as next year to develop land use control language or a possible ordinance(s). SLCO said developing a management philosophy for remediated areas is necessary to keep track of areas in a rapidly developing Salt Lake West Bench. SLCO said by mapping areas, using title search and survey records, or incorporating a checklist process, there are many ways SLCO can assist with transparency about previous remediation work and can assist with ensuring the protectiveness of the selected remedy for OU1 Bingham Creek.

5) Do you have any knowledge of any actions or events that may have caused for a reduction of the protectiveness of the remedy? The current area of concern for SLCO is a 150 acre residential development that is located north of the OU1 Bingham Creek site (but is crossed by a historic rail line used as an ore haulage route). SLCO expects the developer to follow all general safety measures and will look for any areas of concern within OU1.

6) Does SLCO have records on their maintenance activities for the area?

The SLCO District Attorney said he has all of the documentation associated with the Bingham Creek cleanup and would share with interested departments to assist them with an understanding about past work.

7) Do you have any additional comments, suggestions or questions regarding the clean up? No additional comments were provided. The representatives did discuss scheduling future meetings with EPA and UDEQ to develop possible land use controls to be managed by SLCO.

Subject: Transmittal of Final Reports

Dear Ms. Johnson:

Enclosed under cover of this letter of transmittal are one copy each of the following final reports for Kennecott removal projects completed recently:

- South Jordan Evaporation Ponds, 4 volumes
- Bingham Flats, Evaporation Pond Canals and Pond AO, 2 volumes
- Holy Cross Jordan Valley Hospital

These reports are transmitted for your files. Please do not hesitate to call if there are questions or comments, or if further information is desired.

Sincerely,

Ivan Weber

RE: Notice of Completion and Final Report
Bingham Creek Channel Site T4
Holy Cross Hospital

Dear Mr. Way:

Transmitted under cover of this letter are four copies of the Final Report for the segment of Bingham Creek Channel (Phase II) work that encompasses the site of the Holy Cross Hospital property, at the northeast corner of the intersection of 90th South Street and the Bangerter Highway in Salt Lake County, Utah. Kennecott's removal work at the Holy Cross Hospital site was conducted in 1992, prior to the finalization of the Unilateral Administrative Order for Removal Action ("Order"), concurrent with the Delta M8 Phase I removal. In compliance with understandings established at the time of development of work plans for Phase II of Bingham Creek Channel, however, this Final Report is submitted in compliance with requirements of the Order, CERCLA-VIII-93-10, and the Statement of Work (section III, paragraph M.2).

In compliance with Article XVIII paragraph 72 of the Order, a signed Notice of Completion is enclosed. The original signature document is in the copy designated as "original" on the cover.

Separate final reports and notices of completion have been submitted previously for your review for other segments of Bingham Creek Channel Phase II. These include 4800-3200 West, Mixed Tailings, Robbe Cells/Tailwater Ditches, Cemetery Pond and Rock Dam to Property Line. A final report for the Bingham Flats, Evaporation Pond Canals and Pond AO is being transmitted under separate cover.

Kennecott requests that certification of completion for this final report be sent by EPA when review has been completed.

Please call if you wish to discuss this report, or any of the other segments of the work related to the Order for Phase II Bingham Creek Channel.

Sincerely,

William R. Williams
Director, Health, Safety and Environmental Quality

NOTICE OF COMPLETION

HOLY CROSS JORDAN VALLEY HOSPITAL
PHASE II BINGHAM CREEK CHANNEL SITE T4

Pursuant to Paragraph III.M.2 of the Statement of Work attached to the Unilateral Administrative Order for Removal Action (CERCLA VIII-93-10) Bingham Creek Channel, Phase II, SSID #T4, Kennecott Corporation submits the accompanying Final Report for the segment of the Site at the Holy Cross Jordan Valley Hospital, and certifies that all activities required under the Order have been performed and completed.

As required by the Order, I certify that the information contained in or accompanying this Notice of Completion is true, accurate and complete. As to those identified portions of this Notice of Completion for which I cannot personally verify their truth and accuracy, I certify as the official having supervisory responsibility for the persons who, acting under my direct instructions, made the verification that this information is true, accurate and complete.

1.0 INTRODUCTION

1.1 Final Report Compliance with Order

This Final Report is submitted in compliance with, and in satisfaction of the requirements of the Unilateral Administrative Order (UAO) and Section III M Part 2 "Final Report" of the Statement of Work, attached to the (UAO).

1.2 Site Description

The description of the Bingham Channel Phase II Site T4, as stated in the UAO, includes the "Bingham Creek Channel and its associated floodplain and alluvial fans from the Brookside Trailer Park east of Redwood Road to the base of the Large Reservoir located on Kennecott property", and the area located at the northeast corner of 3200 West and 9000 South.

Bingham Creek originates in Bingham Canyon and was the primary drainage from the mining district in this area. Bingham Creek Channel historically flowed east approximately 14 miles to the discharge point at the Jordan River in Midvale, Utah. The Large Bingham Reservoir on KUC property (Section 17, Township 3 South, Range 2 West, Salt Lake Base and Meridian) now captures the head-water flow from the canyon. Bingham Creek Channel essentially begins at the east toe of the reservoir and is predominantly a dry creek channel, except for water transported during run-off, storm events and irrigation episodes.

Soils sampling conducted by the EPA in the Spring of 1991 indicated elevated levels of lead and arsenic in the soil in and adjacent to Bingham Creek on Holy Cross Jordan Valley Hospital (Hospital) property (Dwg No. 453-T-164). Lead and arsenic are hazardous substances as defined by 101(14) of CERCLA. It is believed that the elevated levels of lead and arsenic are a result of historic lead mining, beneficiation, and extraction activities and downstream transport of the resulting tailings.

Bingham Creek Channel runs across a section of the Hospital property at approximately 9000 South and 3500 West. Removal of the tailings from Bingham Creek Channel on the Hospital property was undertaken by Kennecott to eliminate the potential health risk to the public during the expansion of the Hospital and construction of the West Valley (Bangerter) Highway immediately west of the Hospital. The site boundary and haul roads for this project are shown on drawing 453-T-169.

1.3 Summary of Removal Action

Kennecott and its contractors performed the excavation and transportation of the tailings from the Hospital property during the 1992 Construction Season. The tailings were placed by Kennecott in Bluewater I Repository located on Kennecott property.

The removal activities began on July 1, 1992, at the west end of the property adjacent to 9000 South. Excavation proceeded in Bingham Creek from west to east to completion at the Hospital's east property boundary. Excavation of tailings was completed on July 29, 1992. Recontouring and seeding of the area was completed in November of 1992.

A Work Plan, including Air Sampling and Analysis Plan, Health and Safety Plan, and Soil Sampling and Analysis Plan was followed throughout the project. Post-removal soil sampling was conducted according to the Soil Sampling and Analysis Plan. The sampling plan was revised after discussions with an EPA Representative, the changes are reflected in the post-removal soil sampling report enclosed. Post-removal soil samples were collected as removal activities proceeded. Analytical sample results were used to determine the soil lead and arsenic concentration following the tailings removal. Reclamation activities for the channel proceeded after area was determined to be "clean".

2.0 SCOPE OF REMOVAL

2.1 Objectives of the Removal Action

The objective of this removal action was to remove the tailings and associated contaminated soils from Bingham Creek on Holy Cross Jordan Valley Hospital property. The removal action eliminated the risk for human exposure to potentially hazardous substances.

2.2 Removal Criteria

Pre-removal soil characterization sampling was conducted by the EPA in 1991 to delineate the extent of mine waste contamination. The response action, as outlined in the UAO for Bingham Creek Channel, required removal of tailings and associated soils with lead concentrations in excess of 2000 ppm or to a depth of three feet from existing grade. Kennecott conducted the removal action in accordance with this requirement.

Post-removal soil sampling was conducted in the areas of excavation once the area was designated as "clean". Additional soil removal was required in some areas where the clean-up objectives were not achieved initially. The removal of additional soils beyond a depth of three feet was left to the discretion of Kennecott representatives. Vegetation that did not interfere with removal procedures or vehicle traffic was not removed.

2.3 Personal Protection

Personal protection and related air monitoring activities were implemented according to the Air Monitoring and Analysis Plan and the Health and Safety Plan include as appendices to the Work Plan.

Air monitoring at the excavation and repository sites was conducted throughout the project. Air monitoring was conducted by Kennecott to assess levels of airborne arsenic, lead and total airborne dust, to achieve objectives stated in Appendix A of the Work Plan, as well as compliance with applicable occupational health regulatory requirements. The project air monitoring results are tabulated in the Final Air Monitoring Report.

Level D personal protective equipment (basic OSHA construction safety equipment) was appropriate for all workers engaged in excavation, transportation, and repository activities. Personal protective equipment was upgraded to modified Level D (half face respirator with HEPA cartridges) based on results from air sampling or task specific duties. All personnel received 40-hour Hazardous Substance Training prior to working in exclusion zones. Medical Surveillance as outlined in the Health and Safety Plan was conducted on this project. The Final Health and Safety Report shows the results of implementation of the Health and Safety Plan.

2.4 Kennecott Excavation Procedures

Preparation for tailings removal began Monday, June 29, 1992, by building access roads and clearing debris in Bingham Creek on the Hospital property. Excavation and haulage of tailings from the Hospital area began on July 1, 1992, and were completed on July 29, 1992.

Excavation of tailings from Bingham Creek Channel began at the west (upstream) end of the Channel on the Hospital property to prevent re-contamination of cleaned areas during the removal. The tailings were excavated using a tracked excavator positioned in the bottom of the channel. The excavation was visually guided with the interface between natural ground and tailings distinguishable by color. The excavation proceeded from west to east except for approximately the last 100 feet

which was excavated from east to west to provide access for the haul trucks. The excavator was able to load the haul trucks directly, so stockpiling was not necessary. Following removal of the mine waste, the channel was recontoured and revegetated.

2.5 Recontouring and Revegetation

Recontouring of the channel began after all post removal soil sampling was completed. Clayey material and rip-rap was imported to construct a settling basin at the west end of the excavation area adjacent to 9000 South. The settling basin was constructed to prevent recontamination of the removal area by transportation of tailings from upstream. Once the settling basin was completed, recontouring of the channel began.

In order to re-establish the flow line of the Channel, material from the surrounding area and imported material were used in the recontouring. Local borrow material was used to recontour the west end of the removal area. A limited amount of local borrow was available for recontouring, therefore imported fill was required to re-establish the flow line. Fill material was imported, placed and compacted at the east end of the property where the Hospital established a new entrance by crossing Bingham Creek Channel. A box culvert in Bingham Creek was placed by the Hospital contractor for the new entrance road. Upon completion of the recontouring, the channel was seeded to establish vegetation in the area. The revegetation was completed the first week of November.

The reclaimed area was scarified to a depth of six to eight inches on the contour to prepare the ground for seeding. Fertilizer was applied to a rate of 40 pounds of available nitrogen per acre using a 2:1:1 ratio of a nitrogen, phosphorous, potassium blend. The seed and fertilizer were applied by hydroseeding. The seed and fertilizer were mixed in with wood fiber mulch and tackifier, and then applied at a rate of 1500 lbs. per acre.

The following seed mixture was used.

Species	Variety	Lbs. PLS/acre
Western Wheatgrass	Rosanna	5.0
Thickspike Wheatgrass	Critanna	4.0
Slender Wheatgrass	Revenue	4.0
Streambank Wheatgrass	Sodar	4.0
California Poppy	---	1.5
Desert Marigold	---	1.5
Total		**20.0**

3.0 TRANSPORTATION PROCEDURES

Tailings material was hauled from the excavation site to the repository using appropriate haulage trucks. The type of haul trucks varied due to space limitations. Haul trucks had secured gates and were tarped from the loading zone to the repository to control potential release of contaminants.

3.1 Types of Equipment

Small end-dump trucks and end-dumps with pups were used to transport excavated materials from the removal area to the repository. The end-dumps were able to maneuver throughout the channel and channel haul roads. The trucks backed to the loading equipment, were loaded, and hauled the excavated material out through the bottom of the channel. End-dumps with pups were used where turnabout area was available.

3.2 Haul Routes

Excavated materials were hauled from the Hospital property to Bluewater I Repository using the new hospital access road, then proceeding on public roads to Kennecott property. The haulage equipment exited the removal area on to 9000 South, proceeded to the Old Bingham Highway, and then onto Highway 111 to the Kennecott Gate 47 (Dwg 453-T-169). The haulage equipment then proceeded to the repository using haul roads shown on drawing 451-T-807. The same roads were used as a return route. Ramps were constructed within the removal area as required to maximize the efficiency of the operation and were removed when the operation was completed. Public road weight limits were adhered to and drivers were trained in aspects of transporting over public roads.

3.3 Decontamination Procedures

Decontamination procedures were implemented at the removal and repository sites throughout the project. Prior to entry onto public streets, inspection of the haul trucks was performed in a decontamination zone. All visible soils on the exterior of the truck were removed. Haul trucks were covered prior to entry onto the public streets to prevent release of airborne emissions. All equipment was dry decontaminated prior to leaving the Hospital site, and wet decontaminated before leaving the project. Once removal activities were completed on the Hospital site, unpaved haul roads and "decon" areas were decontaminated by removing the top two to four inches of soil. The material was transported to the repository.

3.4 Engineering Controls

Water spray on haul roads and tarped haul trucks were the only engineering controls required to control airborne emission. Frequent air monitoring was conducted to document airborne emissions from the work zone and to determine the need for additional measures.

4.0 PLACEMENT OF CONTAMINATED SOILS

Bluewater I Repository is located in the Bluewater I drainage basin between two ridge tops within a natural draw. It occupies an area contained within Kennecott's present leach collection system. A system of dirt haul roads provides access to the repository.

4.1 Description

Bluewater I Repository is located on Kennecott property within the North half of the South-east quarter of Section 18, Township 3 South, Range 2 West, Salt Lake Base and Meridian. Approximately 12,463 cubic yards of tailings and associated soils were removed from Bingham Creek on the Hospital property and placed in Bluewater I Repository. Volume of tailings removed was determined using truck scales and a conversion of 1.6 tons per cubic yard calculated from soil dry density test results.

The repository consists of a clay bottom lining with a seepage collection system. A composite, low permeability clay barrier and soil cap was constructed once placement of tailings was completed in the repository. Closure of Bluewater I Repository was conducted in compliance with the requirements of the State Groundwater Discharge Permit Number UGW350002. A final report documenting repository cap construction is in preparation, in accordance with permit requirements copies of which will be sent to EPA when the report is submitted to the State.

4.2 Air Monitoring

Air monitoring at the repository was conducted by Kennecott to assess level of airborne arsenic, lead (as indicator metals), and total airborne dust. Quantitative air monitoring was conducted to document repository personnel exposure using appropriate monitoring equipment.

Samples of air at the perimeter of work zones were collected during excavation and repository work activities. The Final Air Monitoring Report shows results of these samples.

Re: Transmittal of Unilateral Administrative Order for Bingham Creek Channel, Phase II Site, Salt Lake County, Utah

Dear Messrs. Joklic and Lonergan:

Enclosed please find an original, fully executed Unilateral Administrative Order concerning the Removal action planned this spring for the Bingham Creek Channel, Phase II site, located in Salt Lake County, Utah. This Order, issued to both ARCO and Kennecott, is effective on the twenty-first day after the date of issuance. An opportunity for negotiation of an Administrative Order on Consent has been provided for in the Order and notice of intent to negotiate must be received in our offices no later than seven days after the date of issuance of this Unilateral Order.

Should you have technical questions concerning this Removal action, please contact Steve Way at (303) 294-7080. Legal questions can be addressed to Karen Kellen at (303) 391-6201.

I look forward to your prompt response in this matter.

Sincerely,

Robert L. Duprey, Director
Hazardous Waste Management Division

I. JURISDICTION

1. This Unilateral Administrative Order ("Order") is issued pursuant to the authority vested in the President of the United States by Section 106(a) of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980, as amended ("CERCLA"), 42 U.S.C. § 9606(a). This authority was delegated to the Administrator of the United States Environmental Protection Agency ("EPA") on January 23, 1987, by Executive Order No. 12,580, 52 Fed. Reg. 2,923 (1987), and has been further delegated to the Regional Administrators by EPA Delegation No. 14-14-B, and to the Director of the Hazardous Waste Management Division of EPA Region VIII.

II. PARTIES BOUND

2. This Order shall apply to and be binding upon Kennecott Corporation, Kennecott Utah Copper Corporation (together referred to as "Kennecott") and Atlantic Richfield Company ("ARCO") (collectively referred to as "Respondents") and upon all directors, officers, principals, employees, agents, successors, and assigns of Respondents. No change in corporate status of Respondents shall in any way alter, diminish, or otherwise affect Respondents' obligations and responsibilities under this Order.

3. Respondents shall be responsible for carrying out all actions required of Respondents by the terms and conditions of this Order.

III. DEFINITIONS

4. For purposes of this Order, the following terms shall have the meanings set forth below:

"**Contractor**" means any person, including the contractors, subcontractors, or agents, retained or hired by Respondents to undertake any Work under this Order.

"**Day**" means calendar day, unless otherwise specified.

"**Deliverable**" means any written product describing the Work performed or to be performed, including but not limited to, the Sampling and Analysis Plan, Alternative Analysis, Health and Safety Plan or Phase II Work Plan, that Respondents are required to submit under the terms of this Order.

"**NCP**" means the National Oil and Hazardous Substances Pollution Contingency Plan, 40 C.F.R. Part 300.

"**Order**" means this Order, the exhibits attached to this Order, and all documents which are incorporated into this Order according to the procedures set forth herein.

"**Site**" means the Bingham Creek Channel Phase II Site including the areal extent of contamination and all suitable areas necessary for implementation of the removal action, including any temporary staging or storage areas for contaminated soils. The Site includes the area described in Paragraph 6, below, and depicted on the maps attached as Exhibit 2.

"**Statement of Work**" or "**SOW**" means the Statement of Work which is attached hereto as Exhibit 1 and incorporated herein by reference.

"**Work**" means all tasks required by this Order, including all activities related to the performance of such activities.

5. All other terms, not otherwise defined herein, shall have their ordinary meaning unless defined in CERCLA or the NCP, in which case the CERCLA or NCP definition shall control.

IV. FINDINGS OF FACT

SITE DESCRIPTION AND HISTORY

6. The Bingham Creek Channel Phase II Site includes the Bingham Creek Channel and its associated floodplain and alluvial fans from the Brookside Trailer Park east of Redwood Road to the base of the Large Bingham Reservoir located on Kennecott property. Also included in the Site is the area located at the corner of 3200 West and 9000 South ("Northeast corner"). The Site is located in Salt Lake and Tooele counties, Utah (see maps attached as Exhibit 2). The rock and\or concrete lined channel through the Jordan View subdivision is not included in the Work under this Removal action.

7. From approximately 1904 until 1932, companies, including Utah Apex Company and Utah Copper Company, mined and milled lead and/or copper ores in Bingham Canyon. The residual "tailings" material from the milling operation, which contained lead and arsenic, was disposed of in waste piles near the mills or directly into Bingham Creek. Normal runoff events and flooding transported the tailings down Bingham Creek and deposited them along the banks of the channel.

8. In 1905 Utah Copper Company built a tailings impoundment north of Bingham Creek on property later acquired by Kennecott (hereinafter "Kennecott Tailings"). In 1914, Utah Apex Company built a tailings impoundment south of Bingham Creek on property later acquired by ARCO (hereinafter "ARCO Tailings"). Tailings from some of the mills in Bingham Canyon were disposed of into these impoundments while Utah Apex Company and Utah Copper Company were the respective owners of these properties. Sampling activities conducted by EPA in September 1992, at the Kennecott Tailings, revealed lead levels ranging between 270 and 8400 mg/Kg. Sampling activities conducted at the ARCO Tailings at the same time showed an average lead concentration of 6,244 mg/Kg with a range of 1,800 to 15,000 mg/Kg.

9. Runoff events and flooding caused tailings to erode from the Kennecott and ARCO Tailings into Bingham Creek Channel. At present the channel flows intermittently due to localized storms and snow melt. However, this flow in the channel has and will continue to transport fine-grained particles such as those particles present in the tailings. In addition, a County engineering study estimates that flow in a 100 year flood event would be approximately 400 cubic feet per second. This volume of flow in the channel would transport significant volumes tailings-related material deposited in the channel.

10. Sampling and analyses performed by EPA and Kennecott independently have identified lead, arsenic and other hazardous substances at the Site. In July/August 1992, EPA collected 85 samples from the Bingham Creek Channel between 4800 West and 3200 West and found lead and arsenic averaging 5,661 mg/Kg and 202 mg/Kg, respectively. The concentrations of lead ranged from 200 to 23,000 mg/Kg and the concentrations of arsenic ranged from 9 to 890 mg/Kg. Similar levels of lead and arsenic are found progressively up the channel as demonstrated by samples collected by Kennecott in 1990. Samples collected by EPA from 8600 South down channel through the Brookside Trailer Park also show elevated lead.

ENDANGERMENT

11. Arsenic is a human carcinogen. Arsenic can be acutely and chronically poisonous and can be fatal if ingested or inhaled in sufficient quantities by humans, livestock, and wildlife. Arsenic compounds are absorbed into the body primarily through inhalation or ingestion.

12. Lead is a cumulative poison which can cause neurologic, kidney, and blood cell damage in humans. Some lead compounds are also animal carcinogens adversely affecting the lungs and kidneys. Children under the age of seven years are especially sensitive to the effects of lead.

13. Several exposure routes are associated with lead and arsenic contamination conditions at the Bingham Creek Channel Site. Direct contact, ingestion, inhalation, and inhalation resulting in ingestion of the lead and/or arsenic contaminated soils and dust pose the primary exposure pathways.

RELEASE OR THREAT OF RELEASE

14. During site assessment (1990 - 1992) activities, EPA identified lead and arsenic in the soil of residential properties in the vicinity of Bingham Creek Channel as a potential threat to human health and welfare. EPA performed a removal action to mitigate the potential threat posed by the contaminated soil in 50 residential properties. The presence of the large volume of tailings at the Site containing high concentrations of lead and arsenic poses a continuing threat of release down-channel and recontamination of previously remediated residential property. The health based action level for lead at the above mentioned residential removal was 2,500 mg/Kg. This level was designed to address only the most critical levels of contamination.

15. Population growth adjacent to and near the Bingham Creek Channel continues to accelerate. The 1980 census report indicated that approximately 1,360 people lived within a 4 mile radius of the Site. The 1990 census report indicated that the population is approximately 2,450 for the corresponding area. New residential development along the channel continues and more is planned.

RESPONDENTS

16. ARCO is the owner and/or operator of the ARCO Tailings, a facility along Bingham Creek Channel, from which hazardous substances were disposed of and/or released into Bingham Creek. ARCO, through its predecessor in interest, owned or operated, at the time of disposal, facilities along Bingham Creek Channel from which hazardous substances were disposed of and/or released into Bingham Creek. ARCO, a corporation incorporated under the laws of the State of Delaware, is qualified to perform the actions set forth in this Order.

17. Kennecott is the owner and/or operator of facilities along Bingham Creek Channel from which hazardous substances were disposed of and/or released into Bingham Creek. Kennecott and/or its predecessor in interest owned or operated, at the time of disposal, facilities along Bingham Creek Channel from which hazardous substances were disposed of and/or released into Bingham Creek. Kennecott, two corporations incorporated under the laws of the State of Delaware, is qualified to perform the actions set forth in this Order.

RESPONSE ACTIONS

18. An enforcement action was taken at Bingham Creek Channel (Phase I) during 1991, pursuant to Administrative Order on Consent, Docket No. CERCLA VIII-91-11. To date, no CERCLA enforcement actions have taken place in the area defined as Bingham Creek Channel, Phase II.

19. On January 28, 1993, EPA Region VIII signed an Action Memorandum documenting the need for this removal action (Phase II), outlining the proposed action and explaining the basis for the decision to take such action.

V. CONCLUSIONS OF LAW

20. The ARCO Tailings, the Kennecott Tailings and the Site are each a "facility" as defined in Section 101(9) of CERCLA, 42 U.S.C. § 9601(9).

21. Respondents are "persons" as defined in Section 101(21) of CERCLA, 42 U.S.C. § 9601(21).

22. Lead and arsenic found on the Site are "hazardous substances" as defined in Section 101(14)(B) of CERCLA, U.S.C. § 9601(14)(B).

23. The past, present, and potential future migration of hazardous substances into the environment described in Section IV of this Order constitute a "release" or threat of "release" as defined in Section 101(22) of CERCLA, 42 U.S.C. § 9601(22).

24. As current and past owners and operators of the Site, and/or as generators of hazardous substances at the Site, Respondents are responsible parties under section 107(a)(1), (2) and (3) of CERCLA, 42 U.S.C. § 9607(a)(1), (2) and (3).

VI. DETERMINATIONS

25. Based on the preceding Findings of Fact and Conclusions of Law and on the Administrative Record for the Site, EPA has determined that:

26. There has been a release and there exists a threat of further release into the environment of hazardous substances from the Site which may present an imminent and substantial endangerment to the public health, welfare, or the environment.

27. To protect the public health, welfare, or the environment, and to prevent and mitigate the imminent and substantial endangerment thereto, it is necessary that a Removal action be taken to abate the release and threat of release of hazardous substances at and from the Site. The activities required by this Order are not inconsistent with the NCP.

VII. NOTICE TO THE STATE

28. EPA has notified the State of Utah of this action pursuant to Section 106(a) of CERCLA, 42 U.S.C. § 9606(a).

VIII. WORK TO BE PERFORMED

29. Based upon the foregoing Findings of Fact, Conclusions of Law, and Determinations, and pursuant to the authority of Section 106(a) of CERCLA, Respondents are ORDERED to plan, implement, perform, and complete all actions required by this Order in accordance with the standards, criteria, specifications, requirements, and schedule set forth in this Order and the attached Statement of Work ("SOW"). The SOW is hereby incorporated by reference into this Order as Exhibit 1.

30. The final EPA-approved work plan ("Work Plan") shall be incorporated into and made an enforceable part of this Order. Respondents shall undertake all tasks described in the Work Plan and complete all tasks according to the approved schedule.

31. All work under this Order is subject to oversight by and the prior approval of EPA. Respondents shall obtain EPA approval for all documents and reports required by the Work Plan and all proposed modifications to documents or reports previously approved by EPA. Commencing or undertaking any removal action at this Site without prior EPA approval is a violation of this Order.

32. The plans, documents, and reports required by the Work Plan shall be subject to review and approval or modification by EPA. Unless otherwise specified in the Work Plan schedule, Respondents shall, within fourteen (14) days of receipt of any EPA disapproval, submit a revised document addressing all deficiencies and incorporating any modifications specified by EPA. At the time a revised document is submitted, Respondents shall submit a cover letter describing their response to each EPA comment and modification and a certification that no other changes were made. Failure to incorporate or address any EPA comment or modification in accordance with these procedures is a violation of this Order. EPA may unilaterally modify any plan, document, or report if Respondents do not make the required modifications.

33. All Work shall be conducted and completed in accordance with CERCLA, the NCP, EPA guidance, and any amendments thereto which become effective prior to the date of completion of Work under this Order. Respondents shall be responsible for identifying and using other guidelines, policies, procedures, and information that may be appropriate for performing the Work.

34. Activities undertaken by Respondents shall be in compliance with all other Federal, State, and local laws and regulations, including permit requirements, unless an exemption is provided by Section 121(e) of CERCLA, 42 U.S.C. § 9621(e). Respondents shall identify all permits, licenses, and approvals which may be required for performance of the Work in sufficient time to obtain such permit, license or approval, where not exempt under CERCLA, and to perform Work as scheduled.

35. Respondents shall perform all Work in a high-quality manner. Deliverables shall be edited for content, organization, grammar, and spelling before submittal to EPA. Failure to perform or prepare Work of high quality shall be considered a violation of this Order.

36. Respondents shall employ sound scientific, engineering, and construction practices in performing Work pursuant to this Order. All tasks performed shall be under the direction and supervision of qualified personnel or contractors with experience in the types of tasks required for implementation of the Work. Respondents shall provide a copy of this Order and any relevant modifications to this Order to any contractor retained or hired to perform any Work and shall condition the performance of Work on compliance with the relevant requirements of this Order.

37. On or before the effective date of this Order, Respondents shall notify EPA, in writing, of the name, title, and qualifications of the personnel and contractors to be used in carrying out the Work. Respondents shall demonstrate to EPA that proposed personnel and contractors possess the qualifications, experience, technical capability, and management capability necessary to perform the Work in a safe and timely manner, consistent with the requirements of this Order. If EPA disapproves of any personnel or contractor, Respondents shall within fourteen (14) days submit the name of another person or contractor and the information outlined above. Any change in personnel or contractor performing Work under this Order shall be submitted, with the information outlined above, to EPA for approval at least seven (7) days before Respondents make such change.

38. All waste disposal conducted by Respondents pursuant to this Order shall comply with all requirements of CERCLA, 42 U.S.C. § 9601-9675, and all regulations and guidance promulgated thereunder.

39. Respondents shall cooperate and coordinate with each other in the performance of activities required by this Order.

IX. REPORTING REQUIREMENTS

40. Beginning thirty (30) days after EPA approves Respondents' Work Plan or seven (7) days before construction activities begin, whichever occurs first and during the course of Work under this Order, Respondents shall submit the following reports to EPA and the State:

a. Weekly Progress. Respondents shall submit weekly progress reports containing the following information and any information required by the Work Plan:

(1) A description of the actions taken toward achieving compliance with this Order, including plans and actions completed, during the reporting period;

(2) A description and estimate of the percentage of the Work completed;

(3) A description of any activities that deviated from or were carried out in addition to those provided for in the Work Plan, which occurred during the reporting period;

(4) Summaries of significant findings pertaining to the removal action during the reporting period;

(5) Summaries of all changes made in the removal action during the previous week;

(6) A description of unresolved problems or potential problems encountered during the reporting period that may cause a performance delay and a description of efforts made to mitigate those problems and/or delays;

(7) Change orders, nonconformance reports, claims made, and actions taken to rectify problems;

(8) Changes in personnel during the reporting period;

(9) Projected work for the next reporting period and a schedule of activities for the next month; and,

(10) Copies of inspection logs and results of all sampling, tests, and other data (including validated analytical data with supporting documentation on Contract Laboratory Program Form I's or in a similar format) received or produced by Respondents during the course of work during the previous week.

These reports shall be provided to EPA and the State by Thursday morning of each week from the effective date of the Order until EPA terminates the Order or otherwise authorizes Respondents to discontinue such reporting.

41. Respondents shall submit all deliverables under this Order by hand delivery or overnight or certified mail, return receipt requested, to the following persons or to such other persons as EPA hereafter may designate in writing:

a. Documents submitted to EPA shall be sent in quadruplicate to:

Steve Way (8HWM-ER)
On-Scene Coordinator
U.S. Environmental Protection Agency
Region VIII
999 18th Street, Suite 500
Denver, Colorado 80202-2405

b. Copies of documents submitted to EPA shall also be submitted simultaneously to:

Brent H. Everett
UDERR
1950 West North Temple
Salt Lake City, UT 84114-4840

42. In the event of any significant change in conditions, emergency circumstances, or immediate endangerment to public health, welfare, or the environment at the Site, Respondents shall immediately notify the EPA On-Scene Coordinator, or if unavailable, his or her supervisor or other appropriate EPA personnel. Respondents shall provide EPA with written notice of the event within seven (7) days of its occurrence. The written notice shall include a detailed description of the event, including time and location, any known causes of the event, the consequences of the event to public health, welfare, and the environment, and actions taken, or to be taken, to stop or mitigate the event.

X. PROJECT MANAGER, ON-SCENE COORDINATOR

43. Within seven (7) days of the effective date of this Order, Respondents shall designate a technical Project Manager and an Alternate Project Manager and shall notify EPA in writing of their names, titles, affiliations, addresses, and telephone numbers. The Project Manager shall be responsible for overseeing implementation of this Order. To the maximum extent possible, communications concerning technical aspects of this Order shall be coordinated through the Project Manager for Respondents and the On-Scene Coordinator designated by EPA. Respondents' Alternate Project manager shall receive communications if the Project Manager is unavailable. EPA retains the right to disapprove of any Project Manager or Alternate Project Manager designated by Respondents.

44. Respondents may replace their Project Manager or Alternate Project Manager by notifying EPA's On-Scene Coordinator in writing of the replacement's name, title, affiliation, address, and telephone number at least five (5) days before the replacement.

45. The EPA On-Scene Coordinator has the authority vested in the On-Scene Coordinator by the NCP. The absence of the EPA On-Scene Coordinator from the Site shall not be a cause for stoppage or delay of Work.

XI. SITE ACCESS AND SAMPLING

46. Respondents shall in no way hinder or impede access by EPA, the State, or their authorized representatives to the Site or any other areas where the Work is conducted. Respondents shall not prohibit such persons from being present on the Site or such other areas at any and all times or from observing any and all Work conducted pursuant to this Order. All persons who engage in activity under this Order shall be available to and shall cooperate with EPA in its oversight of Work under this Order.

47. To the extent that access to property other than property owned by Respondents is required for the proper and complete performance of Work under this Order, Respondents shall use their best efforts to obtain a written right of access for access to such property within ten (10) days of the effective date of this Order. Respondents shall provide EPA and the State with a copy of such right of access within fourteen (14) days of the effective date of this Order. Such agreements shall ensure access for EPA, the State, and their authorized representatives. If Respondents are unable within the deadline specified to obtain such access for themselves, EPA, the State, and their authorized representatives, they shall notify EPA immediately by telephone,

and in writing within three (3) days thereafter, of their failure and efforts made to obtain access.

48. Nothing herein shall limit or otherwise affect EPA's or the State's right of entry pursuant to any applicable statute, regulation, or legal authority.

49. Respondents shall provide EPA and the State written notice at least seven (7) days prior to collecting samples pursuant to this Order. Upon request, Respondents shall provide EPA, the State, and their authorized representatives with split or duplicate samples. Respondents shall allow EPA and the State to take any other samples and conduct any tests and inspections EPA or the State deems necessary.

50. All sampling activity is subject to EPA direction and approval.

51. All sampling and analyses performed pursuant to this Order shall conform to EPA guidance regarding sampling, quality assurance/quality control ("QA/QC"), data validation, and chain of custody procedures. Respondents shall ensure that EPA and State personnel and their authorized representatives are allowed access to any laboratory utilized by Respondents in implementing this Order. Respondents shall ensure that the laboratory participates in a QA/QC program equivalent to that which is followed by EPA. Upon request, Respondents shall have such laboratory analyze samples submitted by EPA for quality-assurance monitoring.

52. If Respondents obtain any samples from property owned by a third party, Respondents shall provide the third party with a receipt describing the samples obtained, and an opportunity to request and obtain split samples. Respondents shall also promptly provide such third party with a copy of the results of any analyses made.

XII. DOCUMENTATION, AVAILABILITY OF INFORMATION, AND RECORD RETENTION

53. For the period during which this Order is in effect, Respondents shall permit EPA, the State, and their authorized representatives to inspect and copy all non-privileged records, files, maps, and other documents, writings, or depictions pertaining to implementation of this Order.

54. Respondents shall maintain a running log of privileged documents on a document-by-document basis containing the date, author(s), addressee(s), the privilege claimed (e.g., attorney work product, attorney-client), and the factual basis for the assertion of the privilege. The privilege log shall be kept on file and available for inspection. EPA may at any time challenge

claims of privilege through negotiations or otherwise as provided by law or the Federal Rules of Civil Procedure.

55. Respondents may assert a business confidentiality claim pursuant to 40 C.F.R. § 2.203(b) with respect to part or all of any information they submit to EPA pursuant to the terms of this Order, provided such claim is allowed by Section 104(e)(7) of CERCLA, 42 U.S.C. § 9604(e)(7). All claims will be reviewed and allowed or disallowed pursuant to 40 C.F.R. Park 2, Subpart B. EPA shall only disclose information covered by a business confidentiality claim to the extent permitted by and by means of the procedures set forth at 40 C.F.R. Part 2, Subpart B. If no such claim accompanies the information when it is received by EPA, EPA may make it available to the public without further notice to Respondents.

56. Respondents shall preserve during the pendency of this Order and for a minimum of six (6) years after termination of this Order, all records and documents in their possession or in the possessions of their divisions, employees, agents, contractors, or attorneys which relate in any way to this Order or Work performed hereunder, notwithstanding any document retention policy to the contrary. At the end of this six year period, Respondents shall make such records available to EPA for inspection or shall provide the original or copies of such documents to EPA. If EPA requests that some or all documents be preserved beyond this six year period, Respondents shall either comply with EPA's request or provide to EPA the original or legible copies of the retained documents.

XIII. MODIFICATIONS TO ORDER

57. No oral advice, guidance, suggestions, assurances, or comments by EPA or its authorized representatives shall modify the terms or conditions of this Order or relieve Respondents of their obligations under this Order.

58. If Respondents seek to deviate from the approved Work Plan, Respondents' Project Manager shall submit a written request to EPA outlining the proposed Work Plan modification and the basis therefor. If EPA approves the Work Plan modification in writing, such modification shall be deemed incorporated into this Order. Deviation from the Work Plan without EPA's prior approval is a violation of this Order.

XIV. EFFECTIVE DATE AND CONFERENCE OPPORTUNITY

59. This Order shall be effective twenty-one (21) days from the Date of Issuance. Each Respondent shall, within seven (7) days from the Date of Issuance, notify EPA, in writing, of its intent to comply with this Order or to request the opportunity to negotiate an Administrative Order on Consent (AOC). If either

Respondent submits a Notice of Intent to negotiate an AOC, this Order shall, with respect to that Respondent, be superceded by any fully executed AOC, which results from these negotiations. Twenty-one (21) days, calculated from the Date of Issuance of this Order, shall be allowed for the negotiation of an AOC. The schedule for performance of Work shall be calculated from the effective date of this Order or from the effective date of the superceding AOC once it is fully executed.

60. Respondents may request a conference with EPA, to occur no later than seven (7) days after the Date of Issuance, to discuss this Order, including its applicability, the appropriateness of activities required to be undertaken, and other issues and contentions relevant to issuance of this Order. Any request for a conference shall be made to Karen S. Kellen, Assistant Regional Counsel, EPA Region VIII, 999 18th Street, Suite 500, Denver, Colorado 80202-2405, (303) 391-6201. At any such conference, Respondents may appear in person or through an attorney or other designated representative. Such conference is not, and shall not be deemed to be, an adversarial hearing or part of a proceeding to challenge this Order, and no official stenographic record of such proceeding shall be kept.

61. If Respondent(s) does not submit a letter of Intent to Negotiate, each Respondent shall, no later than seven (7) days after the Date of Issuance, inform EPA in writing as to whether it intends to comply with the Order. If Respondent(s) submits a letter of Intent to Negotiate but does not reach agreement with EPA within twenty-one (21) days of the Date of Issuance of this Order, then, within twenty-four (24) hours of the Effective Date of this Order, each Respondent shall inform EPA in writing as to whether it intends to comply with this Order. A failure to respond or to indicate an intention to comply with this Order by such date shall be deemed to mean that Respondent(s) does not intend to comply with this Order.

XV. RESERVATIONS, DISCLAIMERS

62. In the event that EPA determines that the activities performed pursuant to this Order or any emergency circumstances may pose a threat to public health or welfare or the environment, EPA may direct Respondents to stop further implementation of Work pursuant to this Order or may take or order further actions to abate the threat. This provision is not to be construed to limit any powers EPA may have under CERCLA, the NCP, or any law or regulation.

63. Nothing herein shall preclude EPA from taking action to enforce this Order, nor from taking any action pursuant to Sections 104, 106, 107, or 122 of CERCLA, 42 U.S.C. §§ 9604, 9606, 9607, or 9622, nor any and all actions pursuant to CERCLA or any other available legal authority, including without

limitation, seeking injunctive relief, monetary penalties, or punitive damages. Nothing herein shall preclude EPA from undertaking any additional enforcement actions and/or other actions it may deem necessary for any purpose, including the prevention or abatement of an imminent and substantial danger to the public health or welfare or the environment arising from Site conditions.

64. Neither EPA nor the United States, by issuance of this Order, assumes any liability for any acts or omissions of Respondents, nor employees, agents, contractors, or consultants of Respondents, in carrying out Work pursuant to this Order. Neither EPA nor the United States shall be held a party to any contract entered into by Respondents, nor by their employees, agents, contractors, or consultants in carrying out Work pursuant to this Order.

65. Nothing in this Order shall affect any right, claim, interest, defense, or cause of action of any party against any entity not subject to this Order for any liability it may have arising from or relating in any way to the Site. Nothing in this Order shall be deemed to constitute a decision on preauthorization of funds under Section 111(a)(2) of CERCLA, 42 U.S.C. § 9611(a)(2).

66. Nothing in this Order shall constitute or be construed as a satisfaction or release from liability for Respondents, nor their agents, contractors, lessees, successors, or assigns with respect to any conditions or claims arising as a result of past, current, or future operations at the Site, ownership of the Site, or use or disposal of hazardous substances at the Site.

67. EPA reserves its rights to seek, pursuant to Section 107 of CERCLA, 42 U.S.C. § 9607, recovery from Respondents of the United States' costs incurred in oversight, administration, and enforcement of this Order, and any other past and future costs incurred by the United States in connection with response activities at the Site not otherwise reimbursed by Respondents.

68. Nothing in this Order shall be construed to release Respondents from any liability for failure to perform the Work in accordance with this Order.

XVI. ASSURANCE OF ABILITY TO COMPLETE WORK

69. Respondents shall establish and maintain a financial instrument, trust account, or other financial mechanism such as one of those set forth at 40 C.F.R. Part 264.143, acceptable to EPA, funded sufficiently to perform the work and any other obligations required under this Order, including a margin for cost overruns. Within fifteen (15) days of the effective date of this Order, Respondents shall either fund the financial

instrument or trust account or demonstrate to the satisfaction of EPA that their financial resources are sufficient to perform the work required under this Order projected for the period beginning with the effective date of the Order through the end of the current calendar year quarter. On or before the 15th calendar day of each calendar year quarter thereafter, Respondents shall either fund the financial instrument or trust account or demonstrate to the satisfaction of EPA that their financial resources are sufficient to perform the work and other activities required under this Order projected for the succeeding calendar year quarter. Within five (5) days of the funding of any account or other mechanism or the demonstration of ability to perform Work, Respondents shall report such to the On-Scene Coordinator.

70. If at any time the net worth of the financial instrument or trust account is insufficient or the other demonstration of financial ability is inadequate to assure performance of the Work and other obligations under the Order for the upcoming quarter, Respondents shall provide written notice to EPA within seven (7) days after the net worth of the financial instrument, trust account or other demonstration of financial ability becomes insufficient or inadequate. The written notice shall describe why the financial instrument, trust account or other demonstration of financial ability is insufficient and shall explain what actions have been or will be taken to fund the financial instrument or trust account adequately or to demonstrate to the satisfaction of EPA that it has the financial resources to continue the Work through the time period required. EPA reserves the right to terminate this Order if funding becomes or will become inadequate.

XVII. ENFORCEMENT

71. Should Respondents violate this Order or any portion thereof, EPA may carry out the required actions unilaterally, pursuant to Section 104 of CERCLA, 42 U.S.C. § 9604, and/or may seek judicial enforcement of this Order pursuant to Section 106 of CERCLA, 42 U.S.C. § 9606. Respondents may also be subject to an action for cost recovery, civil penalties of up to $25,000 per day per violation of this Order, and/or punitive damages (including treble damages), as provided in Sections 106(b), 107(a) and 107(c)(3) of CERCLA, 42 U.S.C. §§ 9606(b), 9607(a) and 9607(c)(3), respectively, for failure to comply with the terms of this Order.

XVIII. TERMINATION AND SATISFACTION

72. Respondents shall submit a written Notice of Completion to EPA upon completion of all Work described in this Order indicating that, in Respondents' opinion, the tasks required by the Order have been completed. The Notice of Completion shall

contain the following statement which shall be signed by a responsible official representing each Respondent:

> I certify that the information contained in or accompanying this Notice of Completion is true, accurate, and complete. As to (the) (those) identified portion(s) of this Notice of Completion for which I cannot personally verify (its) (their) truth and accuracy, I certify as the official having supervisory responsibility for the person(s) who, acting under my direct instructions, made the verification that this information is true, accurate, and complete.

73. The term "responsible official" means: (a) A president, secretary, treasurer or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy- or decision-making functions for the corporation; or, (b) the manager of one or more manufacturing, production, or operating facilities employing more than 250 persons or have gross annual sales or expenditure exceeding $35 million, if authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures.

74. EPA shall make the final determination as to the sufficiency and/or acceptability of all Work conducted under this Order, including but not limited to each required submittal and activity completed. EPA may inspect the Site for adequacy of Respondents' performance of the Work. EPA will notify Respondents, in writing, of any deficiencies and the actions required to correct these deficiencies at the Site. Respondents shall take the necessary corrective measures to address any deficiencies, identified by EPA. This Order shall terminate upon Respondents' receipt of written notice from EPA that Respondents have complied with all terms of this Order.

IT IS SO ORDERED

EXHIBIT I

BINGHAM CREEK CHANNEL SITE
PHASE 2
SSID # T4

STATEMENT OF WORK

February 10, 1993

BINGHAM CREEK CHANNEL - PHASE 2

SSID # T4
STATEMENT OF WORK

I. SITE HISTORY AND BACKGROUND

Bingham Creek originates in the Bingham Canyon and was the primary drainage from the mining district in this area. Although historically, water from the mining district flowed in the channel, the Large Bingham Reservoir now contains nearly all the flow from the canyon. The reservoir is located in Western Salt Lake County, Utah approximately one-half mile East of Copperton, Utah in Section 17, Township 3 South, Range 2 West, Salt Lake Base and Meridian. The channel starts at the toe of the reservoir.

The channel passes through several miles of Kennecott property before reaching a county gravel plant and a brick factory, and then entering residential areas at 4800 West. The channel is accessible year-round and is used as a recreational area and trail by residents in the area. It serves as a storm water drainage during runoff events and receives irrigation wastewater.

Sampling in 1992 by the EPA indicated high levels of lead and arsenic in the soil in Bingham Creek Channel. Samples were collected through residential reaches and from upper reaches on ARCO and Kennecott property. The tailings in the upper reaches also indicated elevated levels of lead and arsenic consistent with those found down channel.

Lead and arsenic were identified at the Site as the contaminants of concern. These are hazardous substances, as defined by § 101(14) of CERCLA, that were released into the environment through mining and beneficiation processes in the Bingham Canyon. Mining waste (tailings), were discharged directly to Bingham Channel and deposited along the banks of the channel upstream from the residential areas. The mining waste was transported primarily by normal runoff events and flooding. The last major flood through the Bingham Creek Channel occurred in 1983. Precipitation events continue to erode tailings into the channel.

Contaminated soil is also wind-blown and disturbed during development activities. Dust-size particles (especially those with diameters of 100 microns or less), are a significant source of exposure, and are transported by wind and human

activities from source areas into yards and homes. Also, irrigating systems contribute to migration of contaminated soil in the channel; the channel receives water released from the irrigation canals.

Analytical results for 85 samples show that the lead levels in the channel soil between 3200 West and 4800 West range from 290 mg/Kg to 23,000 mg/Kg, and arsenic levels range from 19 mg/Kg to 890 mg/Kg. The mean concentrations are 5661 mg/Kg lead and 202 mg/Kg arsenic. Previous sampling indicates that lead levels range even higher in some areas of the channel.

A significant potential for continued human exposure to hazardous substances exists at the Site. Several miles of the channel have soil with an average concentration of lead in excess of 2500 mg/Kg. Approximately 70% of the material from 85 samples tested at the Site passed through a 250 micron mesh, which is the particle size considered most available for human exposure. In addition, concentrated deposits of tailings with high lead levels are frequently observed at depths from six inches to several feet below the surface of the channel.

II. PURPOSE - OVERVIEW

This Statement of Work (SOW) defines the objectives and scope of work that is involved in fulfilling the requirements of the Unilateral Administrative Order (Docket # CERCLA VIII-93-10). The purpose of the work described herein is to address the uncontrolled tailings with elevated lead and arsenic present at the Site and prevent the release or potential release of hazardous substances. This action is designed to protect residents in the area who may be exposed to lead and arsenic levels that may pose a health threat. The scope is limited and is focussed on the channel as a source area that poses a potential for human exposure to high levels of hazardous substance in the channel and poses the potential for recontamination of residential properties remediated in a Removal action implemented in 1991. It should be noted that the threat posed by arsenic will be addressed by this Removal Action. The primary contaminant of concern at the Site is lead.

The scope of work required in this action includes but is not limited to the channel invert, side slopes, and associated flood plain areas. The priority is placed on the channel through the residential reach, which extends from Redwood Road (including Brookside Trailer Park), to 4800 West. The channel reach up gradient from 4800 West is also included in the scope of this Removal Action. Also included in the scope is the area located at the northeast corner of 3200 West and 9000

South. However, generally the action does not include residential properties unless the property is adjacent to or inherently part of the channel, flood plain, or alluvial fans and concentrations of lead in the soil exceed the action level.

The action requires the removal of soil containing lead at concentrations greater than 2,000 mg/Kg or to depths generally not to exceed 3 feet in the channel and placing an adequate cover over contaminated areas to prevent exposure and continued migration of contaminated soil. The channel will be regraded with clean fill from either the banks of the channel or from an off-site borrow source.

Specific elements of the response action are described in more detail below.

A. Channel Area:

The response action calls for removing soil containing lead concentrations greater than 2,000 mg/Kg from the channel, and placing an adequate cover over contaminated areas to prevent exposure. The channel will be regraded with clean fill from either the banks of the channel or from an off-site source.

1. Soil removal depths will depend on conditions in the channel and contaminant depth; generally, the removal depth will not exceed three feet, except in limited areas where pockets of deep deposits may be effectively removed. The lateral extent of soil removal will generally be limited to the channel banks and undeveloped flood plain with lead concentrations in excess of 2,000 mg/Kg.

2. Channel grade and contours will be restored, and soil fill will have sufficient clay content to prevent erosion, due to normal runoff flow and 100 year flood events in the channel. Restoration of the channel must be based on appropriate designs for open channel flow.

3. Vegetation will be re-established where necessary to restore the landscape and stabilize the channel.

4. Culverts, spillways, rip-rap, stilling basins or other systems will be installed as necessary.

5. Contaminated soil will be consolidated and transported to a repository for storage.

The estimated volume of soil that may be removed from the channel between 3200 and 4800 West is 92,000 cubic yards. However, this is not a limit to the amount to be removed. The soil volume requiring removal in the channel below 3200 West is uncertain. It is expected, however, to be significantly less than the upper reaches.

If conditions prohibit adequate removal of contaminated soil, a second approach to stabilizing the channel and preventing exposure is constructing a concrete channel. EPA will determine when and if this approach is appropriate. Conditions that may warrant concrete channelization include side slope stability and proximity to structures such as roads or buildings adjacent to the channel. This option will also require some soil removal in the channel and up the embankments as described above. However, concrete channelization will not be used unless necessary to adequately stabilize the channel to prevent contaminant migration.

A retention or settling basin on the up gradient end of the remediated area may be necessary to prevent recontamination, if the Removal is not completed through the upper reach of the channel.

B. **Lots 9000 South/3200 West:**

The Removal Action calls for removing a minimum of 18 to 24 inches of contaminated soil (lead greater than 2000 mg/Kg). Additional sampling is necessary, however, to identify exact boundaries.

1. Soil excavated from this area must be transported to the approved repository for storage.

2. The area must be restored to original grade and re-vegetated. All haul roads and soil staging areas must be rehabilitated.

Specific requirements that must be addressed in the Work Plan are described below.

III. REMOVAL WORK PLAN

The Respondent shall prepare a draft Work Plan for submittal to EPA 30 days after the effective date of the Order. The Work Plan must describe how the approved Removal action for

the Site as described above will be implemented by the Respondents. The Work Plan must include at a minimum the following elements:

A. SELECTED RESPONSE ACTION AND SITE DESCRIPTION

Describe the EPA approved Removal action with a short overview of the tasks required to implement the Removal. Also provide a description of the Site relating specific areas to the elements of the response action. This section must address the physical characteristics of the channel and the engineering design required for restoration of the channel. The Work Plan must include a digitized copy (for computer) and graphic presentation of current surveyed channel cross sections. The Respondents must coordinate with EPA before obtaining the channel cross sections to determine the location and interval requirements for those measurements.

B. MATERIALS HANDLING AND STORAGE

Methods of materials handling for contaminated soils, clean soils, and stabilized soils (if required) must be described. This section shall include methods and equipment for excavation, transportation on-site, temporary stockpiling, and final placement of stabilized material (if required). Maps depicting access routes, stockpile areas, work areas, etc., shall be provided.

C. DISPOSAL FACILITY

If an off-site disposal facility is used to meet the requirements of the response action, the plan shall list the name and location of the facility. If an on-site repository is selected, the design specifications and construction QA/QC plans must be submitted in the Work Plan. The EPA shall have final approval of the use of the proposed disposal facility.

D. TRANSPORTATION

Transportation of contaminated material to the repository and the routes for hauling off-site borrow material is to be addressed. This section shall discuss the types of vehicles, routing and load limits. Primary and alternate routing from the Site to the disposal facility shall be listed. Maps of the route shall be attached. Any required permits shall be obtained from the appropriate agency. Appropriate traffic control measures must be provided for during hauling activities.

E. ENGINEERING CONTROLS

Controls to prevent release of contaminants off-site shall be addressed in this section. Also to be addressed are the final grading, contouring, erosion controls, and re-vegetation of the Site. Methods for dust suppression from the trucks (tarping, wet loads) and from the roadways, shall be addressed. This requirement also includes necessary retention or stilling basins to mitigate recontamination of the channel from upper reaches that may not be addressed during the construction season.

1. DUST SUPPRESSION

Methods of dust control to be used during excavation, transportation, and placement of soil must be addressed.

2. EROSION CONTROL

Methods of erosion control, both during and after completion of the Removal, must be addressed. Long term monitoring of erosion control methods must also be addressed.

3. FINAL CONTOURING

The channel must be re-established to ensure the appropriate flow capacity using standard methods of open channel design. The Site shall be recontoured to meet with existing native ground contours, and to minimize erosion due to air and water action. During construction grade control must be maintained with engineering surveying. Generally, only those measures necessary to ensure the stability of the channel will be required and no additional work such as replacement of existing culverts related to routine flood control measures will be required.

4. RE-VEGETATION

Methods of re-vegetation for the final configuration on the site shall be addressed. The mixture of seed to be used for vegetation shall be approved by the EPA.

F. SAMPLING and ANALYSIS/TESTING PROCEDURES

Sampling and analysis will be necessary to fulfill the requirements of the response. Soil sampling will be necessary to delineate perimeter areas for excavation, defining the depth and lateral extent of contamination and similar objectives. The respondents must determine the potential for leaching of hazardous substances from the

soil to be placed in the repository. A sampling plan for confirmation of concentrations of hazardous substances in the removal area after excavation of soil must be implemented. To the extent it is necessary to collect multimedia samples, the procedures and plans for sampling all environmental media must be addressed in the Work Plan.

Also, data related to the repository design specification and materials testing must be provided as necessary, and the appropriate testing procedures must be addressed in the Work Plan.

Details for the sampling and analyses procedures must be provided in the sampling and analysis plan (SAP) as described in Section IV.

G. WORK AREAS

Work areas shall be outlined. Maps of the proposed work areas shall be provided.

H. SITE SECURITY

Security shall be maintained at the Site and the work plan must describe in general the plans for maintaining security.

I. PERSONNEL AND EQUIPMENT REQUIREMENTS

The work plan must identify labor mix and the number and types of equipment required to implement the action. Key management/supervisory personnel who will be available on-site must be identified.

J. PERSONNEL AND EQUIPMENT DECONTAMINATION

Decontamination procedures for personnel on-site shall be addressed in this section. Decontamination procedures for all equipment used on-site shall be listed. Disposal of decontamination materials shall be addressed. Criteria for release of equipment off-site shall be addressed.

K. OPERATION AND MAINTENANCE

Requirements for ensuring the long term effectiveness of the Removal such as monitoring ground water, maintenance of the capping, erosion control and site security will be addressed in the Removal Work Plan. If necessary, sampling to determine if contaminated soil has migrated

into clean areas must be implemented during construction and after demobilization.

L. ARARs

The Respondent must specify in the Work Plan how the applicable or relevant and appropriate requirements will be complied with during and after the implementation of the Removal action.

M. REPORTING AND DOCUMENTATION

1. WEEKLY REPORTS

In addition to the weekly reporting specified in the Order, weekly reports submitted to the EPA must also detail Site activities, volumes of materials excavated, volumes of materials stockpiled, volumes of materials stabilized (if required), volumes of materials transported off-site, and any injuries/accidents on-site. Additional reporting will be made immediately available in the event of an emergency or deviation from the Removal Work Plan. Confirmation soil sampling results must be summarized and reported also.

2. FINAL REPORT

A final report detailing all major tasks and critical data regarding volumes, area and depths associated with materials excavated, stabilized, transported and placed in storage shall be submitted to EPA 60 days after completion of all work on the Site. The report shall detail all confirmation samples taken on-site and the analytical data from the sampling. Long term erosion protection/monitoring shall also be addressed in the final report. An engineering survey of the channel must also be provided in graphic and digitized formats for conditions before and after the implementation of the response action. In addition, photographic documentation of the final channel construction must be provided in the report.

IV. Sample Analysis Plan (SAP)

The Respondents will develop a site specific Sampling and Analysis Plan (SAP). The individual sections, as outlined below, must be addressed in the SAP. The SAP must be submitted to EPA for comment and approval as part of the Work Plan. The SAP shall be applicable to all phases of work performed under the Order. The SAP must include the following

elements and it must be consistent with the Quality Assurance/Quality Control Guidance for Removal Activities - Sampling QA/QC Plan and Data Validation Procedures, April 1990 (EPA/540/G-90/004).

A. SITE HISTORY AND BACKGROUND

A brief site history and background introduction will be given. The availability and quality of existing data for the Site will be addressed in this section. Previously obtained analytical results from sampling activities shall be described and used to develop the SAP. EPA will determine the usefulness of existing data and the need to expand upon that data. To the extent that existing data is relied upon to direct activities during the response action, a summary of the existing data shall be submitted with the Work Plan.

B. RATIONALE FOR SAMPLING DESIGN

The rational for the overall sampling design, and for specific matrices and locations, must be given. Representative sampling procedures for soil must be applied for determination of heavy metals concentrations. Specifically, statistically random approaches for selecting specific locations for grab samples must be employed.

C. SAMPLES - LOCATIONS AND NUMBERS

The location and number of samples to be taken for each subcategory below shall be listed.

1. TAILINGS AND SOILS
   a. SURFACE
   b. SUBSURFACE

2. WATER
   a. SURFACE
   b. SUBSURFACE

3. AIR

D. EQUIPMENT DECONTAMINATION CHECK SAMPLES

E. ANALYTICAL METHODS

EPA approved analytical procedures shall be utilized for each matrix. The table shall list the EPA reference number for the procedure and the detection limits for each matrix. Conditions may warrant using X-ray florescence (XRF) for screening soil samples

during the removal operations. Appropriate confirmation analyses using standard EPA methods would also be required.

The Respondent's laboratory shall be identified to the EPA for approval prior to Site operations. The EPA at its option, may perform an audit on the laboratory selected.

1. SOIL

2. WATER

3. AIR

F. QA/QC PROTOCOLS

Quality Assurance/Quality Control procedures must be consistent with accepted EPA standards as described in the above referenced guidance. Generally, quality assurance objective 2 (QA2) must be achieved for the sampling and analyses at the Site. However, QA1 (including XRF analytical methods) data may be used with appropriate quality control and confirmation analyses.

G. SAMPLING PROCEDURES

The plan shall address the procedures for obtaining representative samples for each matrix as listed below:

1. TAILINGS (SURFACE AND SUBSURFACE)

2. SOILS (SURFACE AND SUBSURFACE)

3. SURFACE WATER

4. GROUND WATER

5. AIR

6. EQUIPMENT DECONTAMINATION SAMPLES

H. SAMPLE CUSTODY

Procedures for sample custody, logbooks, recordkeeping, in the field and in the laboratory must be described in the SAP.

I. SPLIT SAMPLES

Split samples will be available for EPA during all sampling activities. In any case where the analytical results differ, the EPA shall have the final determination as to which results shall be used in determining clean-up objectives.

J. DATA REDUCTION, VALIDATION, AND REPORTING

Reduction of the analytical data, validation procedures for the data, and final reporting format for the data shall be addressed.

K. DATA QUALITY OBJECTIVES

The Data Quality Objectives for all sampling activities must be described in the SAP. Generally QA1 and QA2 objectives are appropriate. Procedures for achieving the necessary Q level including the laboratory and field duplicate samples, matrix spikes, performance Evaluation samples, limits of detection must be described.

L. DECONTAMINATION

Decontamination areas and methods, for equipment and personnel, shall be addressed.

M. REPORTING AND DOCUMENTATION OF ANALYTICAL DATA

A final report detailing all sampling activity on-site, analytical data, procedures used for sampling, analytical procedures used, QA/QC controls, and data validation results shall be presented to the EPA within 30 days of completion of the removal phase of work. Summary reports of analytical results must be submitted to EPA 21 days after the sample collection dates for each sampling event, or 7 days after receiving analytical results whichever is less. When analytical results are obtained during the implementation of the Removal action that effect soil removal decisions such data must be made available to EPA immediately.

V. PROJECT SCHEDULE

A schedule of operations for the Removal must be developed addressing the specific tasks to be accomplished, the anticipated start date, the duration of the tasks, and the projected completion date. This must include the sequence in

which the specific reaches of the channel are scheduled for earth moving and re-habilitation activities.

VI. HEALTH & SAFETY

A Site Health and Safety (H&S) plan for all anticipated activities at the Site must be developed and submitted to EPA prior to initiation of work on Site, pursuant to the Order. The H&S plan shall cover anticipated activities and personnel for both Phases of work under this Order. The plan shall address required training, medical monitoring, and personnel health and safety. In addition, a site specific safety plan shall be developed for Site activities.

A. REQUIRED TRAINING

All personnel on-site shall complete the training required by the Occupational Health and Safety Agency (OSHA) (1910.120) for workers on hazardous waste sites. Documentation of such training shall be provided to the EPA prior to any on-site activities.

B. MEDICAL MONITORING

A medical monitoring program for workers on-site shall be established as required by OSHA.

C. SITE SAFETY PLAN

A site specific safety plan shall be developed prior to mobilization on Site for any activity. The plan shall describe the tasks to be performed, the hazards (both physical and chemical) on site, the hazards for each task, personnel on site and their responsibilities, hazard monitoring, designated levels of protection for each task (protective clothing, respiratory protection (level A, B, C, or D.)), decontamination procedures and areas, and emergency information (phone numbers for EMS, ambulance, hospital, etc., hospital route with map).

VIII. ACCESS AND PERMITS

Access to the Site shall be secured from the landowners of the specific site and from owners of adjacent lands where required for access to the Site. The Respondent shall obtain, in advance of operations, all required state and local transportation, construction, and operating permits as appropriate for a Removal action pursuant to CERCLA.

STATEMENT OF WORK SCHEDULE OF TASKS
BINGHAM CREEK CHANNEL SITE - PHASE 2

TASKS/DELIVERABLES	START DATE	DUE DATE/ESTIMATED COMPLETION DATE
Draft Work Plan and SAP		30 days after UAO effective date
Final Work Plan and SAP	upon receipt of EPA comments	14 days after EPA comments received
Health\Safety Plan		45 days after UAO effective date
Sampling Activities	7 Days after SAP approved by EPA	ongoing
Removal Action	May 15, 1993	October 30, 1993
Draft Final Report		60 days after response completed
Final Report	after EPA comments received on draft	30 days after EPA comments received
O & M	Completion of Removal action	ongoing

APPENDICES:

Appendix A, Air Sampling and Analysis Plan (including QA/QC) - (Attachment)
Appendix B, Health and Safety Plan - (Attachment)

Appendix C, Soil Sampling and Analysis Plan - (Attachment)

1.0 INTRODUCTION

Tailings containing elevated levels of metals have been identified in Bingham Creek Channel between Bingham Creek Reservoir and the Jordan River. It is believed that the elevated levels of lead and arsenic are the result of historic lead mining, beneficiation and extraction activities and downstream transport of the resulting tailings. These deposits may present a health hazard to residents along the channel. To mitigate this potential health risk, a removal action by a capable party would be in the public interest. Kennecott Utah Copper (KUC) has provided technical support to the State and Environmental Protection Agency (EPA) that will assist in leading to an expeditious solution. The following Work Plan details the removal.

1.1 Site Summary

Bingham Creek Channel is a dry creek channel for most of its length which contains tailings with elevated levels of lead and arsenic. East of the KUC property line, the channel meanders through residential areas, vacant/agricultural land, golf courses, parks, and commercial/industrial property to its discharge point at the Jordan River. Between the KUC property line and the Jordan River, the channel has been sub-divided into work areas to facilitate overall management of the Bingham Creek Channel Removal Action. This Work Plan pertains only to Holy Cross Hospital property. Bounded on the southwest by 9000 South and on the east by Holy Cross Property Boundary. The north and south sides of the channel are bordered by vacant land owned by Holy Cross Hospital. Throughout the area, the channel is approximately five to ten feet deep, varies in width and both slopes are moderately vegetated.

1.1.1 *Tailings Deposits*

Tailings in the creek channel between the KUC property line and the Jordan River are generally found in pockets on inside bends of the channel. The tailings excavated during sampling events were generally continuous throughout the channel. Tailings which appeared to be isolated, unconnected deposits on the insides of channel bends were nearly always connected by thin deposits of tailings which had been covered with other soil subsequent to tailings deposition. Generally, concentrated deposits of tailings are found in deep, narrow portions of the channel while thinner deposits of tailings are found where the channel broadens out and becomes relatively flat.

The tailings are usually yellow, fine-grained material. In several areas the tailings have been mixed with native soil and stream gravels giving them an uncharacteristic texture and color (tan and brown). In those areas where

the tailings have not been disturbed by previous activities, the visual demarkation between tailings and the native soil is clearly identifiable. The visual distinction is less clear but still useful in disturbed areas.

Approximately 6200 cubic yards (CY) of tailings and associated overexcavation have been identified for removal governed by this Work Plan.

2.0 SCOPE OF REMOVAL ACTION

Target soil lead and arsenic concentrations following removal procedures are 1000 ppm and 100 ppm, respectively. If over four feet of tailings and associated soils are removed, sampling will be conducted for verification purposes only. If less than four feet of material is removed and soil clean-up levels are not attained, as indicated by quantitative sample results, additional material will be removed.

2.1 Objective of Removal Action

The objective of this removal action is to remove visible tailings and any associated contaminated soils from Bingham Creek Channel on Holy Cross Hospital property. The tailings removal will mitigate potential health risks to the public through proper work procedures and increase the overall environmental quality of the channel. The following sections detail the scope of the removal action.

2.2 Removal Criteria

Based on results from previous KUC field investigations and similar removal actions conducted elsewhere, removal of visible tailings and a minimum amount of overexcavation will result in soil lead and arsenic concentrations below acceptable levels. Post-removal verification sampling will be conducted in the removal area disturbed by excavation equipment. Target soil lead and arsenic concentrations following removal procedures are 1000 ppm and 100 ppm, respectively. If over four feet of tailings and associated soils are removed, sampling will be conducted for verification purposes only. If less than four feet of material is removed and soil clean-up levels are not attained, as indicated by quantitative sample results, additional material will be removed.

Vegetation in the channel which does not interfere with removal procedures or vehicle traffic will not be removed.

2.3 Removal Procedures

The tailings will be removed using appropriate excavation and transport equipment depending on the width and depth of the channel and the characteristics of tailings deposition.

The work zone will extend from 9000 South to the Holy Cross Hospital property line to the east and will include the haul roads and temporary staging area. The work zone will be delineated by lighted barricades and signs, as necessary. The work zone may be adjusted in the field to best accommodate removal activities and protect human health and welfare.

2.3.1 *Types of Equipment*

Based on results from similar removal actions, a tracked excavator and a dozer will be appropriate for removing tailings from the majority of the channel. Smaller sized rubber tire excavators may also be used to remove tailings in isolated and difficult access areas. The tracked excavator will be used to remove tailings and load trucks in the channel and a dozer will be used to prepare the channel for truck traffic and build access ramps. The tracked excavator and dozer will be used to recontour channel slopes. Other equipment such as loaders (all sizes) and motor graders will be used to build and maintain haul roads, load stockpiled material, or excavate tailings from the channel, as necessary.

2.3.2 *Recontouring*

Excavation of tailings from the slopes and bottom of the channel will leave slopes unstable in some locations. When the natural slope is disturbed to remove tailings, it will be recontoured at a slope no steeper than 1.5H:1V. Natural slopes that are steeper than 1.5H:1V and are not disturbed during the removal action will be left as found. Fill material for recontouring the channel can be removed from both slopes and adjacent fields in places, but imported material may used if necessary.

2.3.3 *Engineering Controls - Work Zone*

Engineering controls, such as water application, during excavation and loading will ensure that both occupational exposures and airborne emissions from the work zone are below accepted, safe levels for total suspended particulates (TSP), lead, and arsenic (as indicators of all metals). The action levels for lead and arsenic are 30 ug/m3 and five ug/m3, respectively. The permissible exposure limit (PEL) for TSP is 15000 ug/m3 (PEL for respirable fraction is 5000 ug/m3). Air monitoring will be conducted during removal activities according to the Sampling and Analysis Plan included in Appendix A to document occupational exposures and airborne emissions from the work zone. Additional engineering controls will be implemented as necessary.

A small, temporary desilting basin including a small dam with an overflow culvert will be constructed south of 9000 South to prevent recontamination of Holy Cross Hospital property.

2.4 Personal Protection

Level D personal protective equipment (basic OSHA construction safety equipment) will be appropriate for all workers engaged in excavation, transportation, and repository activities. A site-specific Health and Safety Plan (Appendix B) is included with this Work Plan based on available information from all investigative activities completed to date.

3.0 Transport Procedures

Excavated tailings will be transported from the channel to the Blue Water I Repository on KUC property using appropriate haul units, designated haul routes, and adequate engineering controls.

3.1 Types of Equipment

Small end-dumps will be used to transport excavated material from the channel directly to the Blue Water I Repository. The small end-dumps are capable of maneuvering throughout the channel and channel haul roads. These units will back to the loading equipment, load, and haul excavated material out through the unexcavated channel bottom. The end dumps will exit the channel using earthen ramps that will be constructed as required to maximize the efficiency of the operation and removed when the operation is completed. All haul units will be tarped to control dust emissions during transport.

As conditions dictate, the size and types of equipment may be modified to match channel conditions.

3.2 Staging Area

A temporary staging area will constructed to support vehicle decontamination, control access to the work zone, and provide an area for vehicle maintenance and storage. The staging area will be used to minimize transport traffic into and out of the work zones, reducing the risk of spreading contaminated material.

Transports will be visually inspected and, if necessary, physically decontaminated before leaving the staging area. Other machinery will be decontaminated upon completion of removal activities. Decontamination equipment such as pressure/steam washers, brushes, and shovels will be maintained in the temporary staging area.

3.3 Haul Routes

Excavated tailings will be transported to the repository using 9000 South to the Old Bingham Highway, and the Kennecott Haul Road to the repository. The haul road for this area will be on the south side of the channel, approximately 10-20 feet from the center of the channel. Where lack of available space prevents use of the south side, the channel bottom or north side of the channel will serve as the haul road. All haul roads in the work zone will have berms on both sides to contain any spillage that may occur. Once removal activities are complete, unpaved haul roads will be decontaminated by removing the top two to four inches of soil, if necessary. This soil will be transported to the repository on KUC property.

3.4 Engineering Controls - Haul Routes

Based on the results from previous removal actions, water spray on unpaved haul roads and tarps on trucks hauling over public roads will be the only engineering controls required to control airborne emissions. Frequent air monitoring will be conducted to document airborne emissions from the work zone and to determine the need for additional control measures.

The temporary staging area will be decontaminated after operations by removing the top two to four inches of soil, if necessary. This soil will be hauled to the repository along with the other excavated material.

3.5 Emergency Spill Contingency Plan

To prepare for an accidental spill of excavated material on public roads or unpaved haul roads, the following precautionary measures will be taken:

- All transports will be equipped with radios to notify the field supervisor in the event of an accidental spill;
- All transports will be equipped with secured gates which will reduce the possibility of an accidental spill;
- Equipment from the work zone will be available at all times while transporting contaminated material; and
- In the event of an accidental spill on public roads, appropriate emergency response agencies may be contacted to provide traffic control or other necessary assistance.

4.0 REPOSITORY LOCATION

The Bluewater I Repository is located in the northern portion of the Bluewater I drainage basin between two ridge tops. It occupies an area of approximately 25 acres, all contained within Kennecott's present leach collection system. A dirt haul road provides access to the repository from Highway 111.

4.1 Description

The repository will receive approximately 6200 CY of contaminated soils identified for the Holy Cross Hospital Site removal action. The repository consists of a clay bottom lining with a seepage collection system and previously placed contaminated soils. A composite low permeability clay barrier and soil cap will be constructed once placement activities are complete for an individual cell.

The contaminated soils will be deposited, graded, and compacted in 8" lifts over existing material and drain system, and compacted in place to a minimum of 90% relative compaction.

4.2 Air Monitoring

Air monitoring at the repository will be conducted by Kennecott to assess levels of airborne arsenic, lead, and TSP. Samples of ambient air at the perimeter of the repository will occasionally be collected during placement activities. Quantitative air monitoring will be conducted to document repository personnel exposure levels using appropriate monitoring equipment.

4.3 Decontamination Procedures

Decontamination procedures at the repository will be similar to those described in section 3.2. Transports will be visually inspected and, if necessary, physically decontaminated before leaving the repository. Other machinery will be decontaminated upon completion of removal activities.

4.4 Engineering Controls

See Sections 2.3.3 and 3.4.

4.5 Emergency Spill Contingency Plan

See Section 3.5.

4.6 Personal Protection

See Section 2.4.

5.0 REPOSITORY OPERATIONS AND MAINTENANCE

After the contaminated soils have been placed and the repository has been capped, the repository will be monitored as described below on a quarterly basis.

Vegetation will be observed at each inspection and repaired or maintained as necessary.

The seepage collection system and surface water diversion system will be inspected at each quarterly inspection. The systems will be cleaned and maintained to provide continuity of their integrity. The repository cap will be inspected for structural defects on the same frequency. If liquid is detected in the seepage collection sump it will be sampled and analyzed for total lead and total arsenic. Sampling and analytical procedures will follow EPA guidelines. If contaminated seepage from the seepage collection system is confirmed, inspection will be increased to a once per week frequency. If flow subsides, the inspection frequency will correspondingly be reduced to quarterly. If flow continues to indicate a problem, a plan for corrective measures will be developed.

6.0 SCHEDULE OF MAJOR MILESTONES FOR WORK PLAN

Excavation/Haulage July, 1992

APPENDIX A:
AIR SAMPLING & ANALYSIS PLAN

APPENDIX A

AIR SAMPLING AND ANALYSIS PLAN

A.1.0 INTRODUCTION

Air monitoring samples will be collected at the work zone and the Bluewater I Repository to monitor airborne emissions during tailings excavation and placement. The sampling will be conducted using Gilian 113 HFS 113A hi-flow and Gilian 520 AC hi-volume pumps to draw air through sampling media. Quantitative air sampling will be used to monitor employee exposures, work zone boundaries, and the repository.

The purpose of air monitoring is threefold:

- Document employee exposure, if any;
- Document work-zone and repository particulate emissions; and
- Evaluate the effectiveness of engineering controls;

A.1.1 BACKGROUND AIR SAMPLING PROCEDURES

Background air samples will be collected prior to any removal, hauling or placement activities. Hi-flow (2.0 L/min) and/or hi-volume (20.0 L/min) samples will be collected at the removal work zone and repository. The background samples will be used to set a datum for airborne particulate concentrations.

A.1.2 PERSONAL AIR SAMPLING PROCEDURES

Personal monitoring will be performed with hi-flow personal sampling pumps drawing air through sampling media following National Institute for Occupational Safety and Health (NIOSH) methodologies. Sampling procedures may be altered at the discretion of field sampling personnel as site-specific conditions warrant. NIOSH sampling results are quantitative and will be used to document work zone and repository air quality and worker exposures.

A.1.3 WORK ZONE SAMPLING PROCEDURES

Air samples will be collected at the removal and placement work zones to determine possible particulate emission and document work zone air quality. The samples will be collected with both hi-flow and hi-volume (if necessary) sampling pumps drawing air through sampling media following National Institute for Occupational Safety and Health (NIOSH) methodologies. Sampling procedures may be altered at the discretion of field sampling personnel as site-specific conditions warrant.

A.2.0 AIR SAMPLING PROCEDURE

The following standard operating procedure (SOP) will be followed for all quantitative sampling conducted.

A.2.1 AIR SAMPLING SEQUENCE

The following sequence of events will be followed for all collected air samples.

1. Fill out logbook header at the beginning of the day;
2. Calibrate sampling pumps;
3. Unplug cassettes and turn on pumps;
4. Document initial information about the individual samples and conditions in a field logbook, including calibrations, start times, locations and a map or diagram; and
5. Ensure required blank (1 per 10 samples) is opened and placed near a sampling pump.

At days end:

6. Turn off pumps, record stop time in field log, and plug cassettes;
7. Recalibrate pumps and record information in both the field logbook and the calibration documentation forms;
8. Place the pumps on charge overnight;
9. Prepare chain of custody forms for all samples; and
10. Either securely store or, package and ship samples, including chain of custodies.

Sequence events are described in detail in the following sections.

A.2.2 LOGBOOK HEADER

An up-to-date sampling field notebook will be maintained by project personnel during all sampling activities. The general information recorded for each day's sampling includes:

- Date;
- Name of overall sampling event;
- Sampling personnel;
- Climatic conditions; and
- Equipment calibrations.

A.2.3 PUMP CALIBRATION

Air pumps will be calibrated using a graduated buret and a soap solution or commercially available primary standard calibration device. With the first method, the pump is hooked up to an inverted buret, air is drawn through the open mouth of the buret, and a soap bubble is formed with the soap solution across the buret mouth. As the bubble moves across two pre-determined graduations on the buret, a stopwatch is used to record elapsed time. From the graduated volume and elapsed time, the volume per time, or flow, can be calculated. Enter this calibration data on a calibration form as documentation. Pumps are calibrated both before and after sampling each day.

A rotameter, a secondary calibration device, can be calibrated against the buret and then used to calibrate each pump. The rotometer has the advantage of simplicity and speed over the soap bubble-buret technique.

A.2.4 LOGBOOK SAMPLE ENTRIES

Quality assurance and quality control (QA/QC) procedures for air sampling require completion of a Field Sampling Log. For each sample collected (including blanks), the logbook must contain:

- Sample number;
- Sampling location;
- Sample Date;
- Start and stop calibrated air flows;
- Average air flow;
- Start and stop time;
- Sampled volume;
- Sampling method (i.e. NIOSH);
- Field observations; and
- A map or diagram.

Significant deviations from sampling protocol shall be formally noted in the field log, along with visiting personnel and unusual circumstances which might affect the sampling.

A.2.5 QC BLANKS

One QC blank should be submitted with each 10 samples. The blanks are unsampled cassettes that are returned to the lab with the other samples as a test for contamination during sampling and transport.

A.2.6 CASSETTE LABEL

To prevent sample misidentification, each sample cassette is affixed with a label. The following information will be recorded on the sample container:

- Date sample collected;
- Sampling pump identification number;
- Sample cassette number; and
- Chain-of-custody number.

A.2.7 CHAIN OF CUSTODY

To establish the documentation necessary to trace sample possession from the time of collection, a chain-of-custody record will be filled out for each sample and accompany every set of samples. The record will include the following:

- The project number;
- Air sample analysis request;
- Sample number;
- Flow rate;
- Length of sampling time;
- Signature of the collector;
- Sample date;
- Signature of person(s) involved in the chain of possession; and
- Time(s) and date(s) of change(s) of possession.

A.2.8 SAMPLE PACKAGING AND SHIPPING

Samples will be packaged in clean areas that are remote from potential contaminant sources. Packing material will be used to stabilize the cassettes during shipment. Samples will be delivered or shipped for analysis once a sufficient amount of cassettes have been collected.

A.2.9 ANALYTICAL METHODS

The air samples collected using NIOSH methods will be analyzed for lead and arsenic (as indicator metals), and total airborne dust (see Appendix B, section 3.2). Samples collected early in the removal action may be analyzed for a suite of metals, determined at a later date. Samples will be analyzed using NIOSH standard methods. Samples for total airborne dust will be collected using cassettes containing pre-weighed filters, and will be analyzed gravimetrically.

A.3.0 QUALITY ASSURANCE AND QUALITY CONTROL

The purpose of data quality assessment is to assure that data generated during the QA program is accurate and consistent with program objectives. The quality of the data will be assessed based on accuracy and completeness. Accuracy is a determination of how close the measurement is to the true value and will be assessed by the cleanliness of blanks. Completeness is a measure of the amount of valid data obtained, compared to the amount that was expected under normal conditions. Ninety (90%) percent completeness is the goal of this plan.

The project data objectives for accuracy and completeness are consistent with guidelines established by NIOSH and OSHA.

A.3.1 SAMPLING CALIBRATIONS

Personal sampling pump flow will be calibrated following NIOSH protocol. The pumps will be calibrated at the beginning and end of sampling each day. The cassette used for pre-calibration will also be used for post-calibration. The two calibrations must be within 20% of each other or the day's sampling for that pump will be invalidated.

A.3.2 QC SAMPLES

Internal quality-control checks will be conducted to evaluate the quality of data based on field conditions and constraints. The field QA/QC program will be conducted in addition to laboratory QA/QC. The following quality-control check will be performed:

- Field Blank - Opened but unsampled cassette placed near an active sampler and returned to the lab with the other samples as a test for contamination during sampling and transport.

- Trip Blank - Unopened cassette that is subject to the same handling as sampled cassettes. The trip blank is returned to the lab as a test for contamination during handling and/or prior to receiving the cassette from the lab.

The above internal QC samples will be evaluated to determine if the field and transport procedures are adequate to provide valid analytical data. The evaluation process for QC samples is outlined below.

One field blank or trip blank will be collected and analyzed for each 10 samples.

A.3.3 DATA REDUCTION, VALIDATION AND REPORTING

All data will be reported in appropriate units. All raw data will be reviewed and validated against calibration records to ensure that data are reliable and that the data are in compliance with QA/QC objectives. Upon completion, a copy of the signed laboratory report will be retained for future reference. Raw data from field measurements and sample collection activities that are used in project reports will be appropriately identified.

QC records, showing accumulated precision and accuracy data, will be maintained in the laboratory and reported along with analytical results. Poor quality results require that the problem be determined and corrected.

A.3.4 QA REPORTS TO MANAGEMENT

Final field and laboratory reports will be submitted to the QA/QC Officer for review; issues requiring clarification will then be addressed. Following review by the QA/QC Officer, final field and laboratory reports will be submitted to the Project Manager.

A.3.5 CORRECTIVE MEASURES

If QC system or performance audits detect conditions or data that do not meet QC requirements, corrective action will be initiated. The nature of the action will depend on the circumstances of each situation and may include:

- Evaluating and amending sampling and analytical procedures; and
- Accepting data, acknowledging level of uncertainty.

APPENDIX B:
HEALTH & SAFETY PLAN

APPENDIX B

HEALTH AND SAFETY PLAN

B.1.0 INTRODUCTION

This site-specific Health and Safety Plan (HASP) applies to activities related to the Holy Cross Hospital site tailings removal, haulage, and placement activities, conducted by employees, contractors, and subcontractors of Kennecott. This plan will be available at all times at the work area for review by employees, contractors, subcontractors, regulatory agencies, or representatives thereof. All visitors and regulatory personnel are expected to be familiar with and comply with all aspects of this plan.

The HASP is designed to identify, evaluate, and control health and safety hazards associated with this project. The plan is based upon existing information regarding the site, similar work conducted elsewhere on Kennecott property, and past experience at other sites. Addressed are specific safety and health hazards and procedures necessary to protect the employees conducting the soils removal.

It is anticipated that site conditions may vary during the project. As actual site conditions change, sections of the HASP may change, and will be subject to approval by the Health and Safety Officer (HSO). Such changes will be communicated to all employees.

B.2.0 COMPREHENSIVE WORK PLAN

A comprehensive work plan for the operations to be conducted precedes this HASP. The work plan describes work tasks, objectives, personnel requirements, and methods for conducting excavation, haulage, and placement of tailings in the repository.

B.3.0 JOB HAZARD ANALYSIS

The potential hazards associated with site activities include both chemical and physical hazards. Equipment operators and laborers directly involved in project activities have the greatest potential for exposure to these hazards. Haulage truck operators have lower potential exposure to these hazards.

B.3.1 PHYSICAL HAZARDS

This section describes normal physical construction site hazards.

B.3.1.1 Heat Stress

Heat stress is a potential hazard associated with elevated body temperatures caused by high ambient air temperatures, heavy physical labor, and/or any combination thereof. This hazard will be evaluated on a day-to-day basis.

B.3.1.2 Cold Exposure

Cold injury (frostbite and hypothermia) and impaired work ability are potential hazards at low ambient air temperatures or when the wind chill factor is low. This hazard will be evaluated on a day-to-day basis.

B.3.1.3 Inclement Weather

Rain, snow, extreme low or high temperatures, or high winds may occur during scheduled work activities. All employees will be trained in the hazards of exposure to cold and/or wet conditions. Protective clothing for cold and/or wet, slippery conditions will be used when needed. Severe weather conditions may result in cessation of work activities at the discretion of the Project Manager, Construction Superintendent or HSO.

B.3.1.4 Utility Lines

Overhead utility lines are present near the work area but should not pose hazard. Appropriate precautions will be taken when working around overhead utilities.

B.3.1.5 Noise

Exposure to elevated noise is expected for heavy-equipment operators. This hazard will be controlled by wearing hearing protection. Either ear plugs or muffs will be encouraged for heavy-equipment operators, laborers, and any other personnel working near the equipment.

B.3.1.6 Construction

As on all construction sites, there is potential for personal injury. American National Standards Institute (ANSI) approved equipment will be required. Hard hats, steel toe boots, and safety glasses will be required to guard against head, foot, and eye injuries. Applicable MSHA and OSHA guidelines will be followed.

B.3.1.7 Dust Suppression

Dust may be generated during excavation, transportation and placement of material. Water spray, tarping of transport vehicles, or other controls will be used, as necessary, to control dust levels. Air monitoring will be conducted to ensure occupational exposures to emissions from the work zone of are below accepted safe levels.

The OSHA Permissible Exposure Limit (PEL) for Total Suspended Particulates (TSP) is 15,000 micrograms per cubic meter in air for any 8-hour time-weighted average (29 CFR 1910.1000).

B.3.1.8 Other Physical Hazards

Other physical hazards such as insect bites, stings, etc. may occur during construction and placement operations. Precautions will be taken to prevent these hazards.

B.3.2 CHEMICAL HAZARDS

Based on available information regarding the site, contaminants of concern identified in the tailings are arsenic and lead. Arsenic and lead have been selected as hazard indicators due to their low Action Levels (AL) and PELs. If additional chemical hazards become evident, appropriate measures will be taken to protect the health and safety of personnel on the site and prevent off-site migration. All employees will be notified of any new hazards as they become known.

B.3.2.1 Arsenic

Arsenic is a solid material with no odor. Potential exposure routes are through inhalation or ingestion. Skin contact can also result in adverse effects. Some arsenic compounds may cause irritation of the eyes, mucous membranes, respiratory system and skin. Dermatitis can also result from poor personal hygiene when working around these materials. Excessive inhalation of arsenic may result in respiratory problems such as coughing and chest pain. Other symptoms include giddiness, headache, and extreme weakness preceding gastrointestinal irregularities. Prolonged exposure can result in weight loss, nausea, diarrhea, pigmentation of skin, and loss of hair. Arsenic is considered a carcinogen: a cancer-causing substance.

The OSHA AL for arsenic is 5.0 micrograms per cubic meter in air for an 8-hour time-weighted average (29 CFR 1910.1018). The OSHA PEL for arsenic is 10 micrograms per cubic meter in air for an 8-hour time-weighted average.

B.3.2.2 Lead

Lead is a solid material with no odor. Potential exposure routes are through inhalation or ingestion. The early effects of overexposure to lead are nonspecific and are difficult to distinguish from the symptoms of minor seasonal illnesses, except by laboratory testing. The symptoms are decreased physical fitness, fatigue, sleep disturbance, headache, aching bones and muscles, abdominal pains, and decreased appetite. More advanced effects include anemia, pallor, a "lead Line" on the gums, and decreased hand grip strength. Lead colic produces intense abdominal pain with nausea and vomiting.

Headache, convulsions, coma, delirium, and kidney damage can occur. Lead is not considered a carcinogen but it is classified as a reproductive toxin and a teratogen (fetal malformation).

The OSHA AL for lead is 30 micrograms per cubic meter in air for an 8-hour time-weighted average (29 CFR 1910.1025). The OSHA PEL for inorganic lead is 50 micrograms per cubic meter in air for an 8-hour time weighted average.

B.3.3 HAZARD MITIGATION

The hazards identified in the above sections, and any additional hazards which arise or are identified during the work will be mitigated by personal protective equipment (PPE), engineering controls, and other safety procedures. Physical hazards will be mitigated by the implementation and enforcement of standard operating procedures described in Section 9.0. Chemical hazards will be identified through the air monitoring program described in Section 7.0 and mitigated by the use of engineering controls.

B.4.0 PERSONAL PROTECTIVE EQUIPMENT

Occupational exposures to arsenic, lead, and TSP are expected to be well below action levels specified in CFR 1910.1018, 1025, and 1000, respectively. Therefore, the level of personal protection to be utilized for all initial site activities is Level D. Level D personal protective equipment (PPE) shall consist of a hard hat (ANSI Z89), safety glasses, (ANSI Z87), steel-toed boots (ANSI Z41 with substantial leather 6-inch uppers), and coveralls. Hearing protection and cotton gloves will be worn as necessary. Work zone visitors will be required to wear applicable safety equipment. The level of protection may be adjusted according to results of employee exposure monitoring, specific job functions, or as site conditions change.

B.5.0 TRAINING REQUIREMENTS

All project employees will receive as a minimum 8 hours of Hazardous Substance Awareness Training. All employees and supervisors working in the excavation and placement of tailings will be required to have 40-hours of hazardous substance training. Employees will be trained to a level required by their job function and responsibility before being permitted to engage in field activities. Pre-employment safety information will include:

- Names of personnel and alternates responsible for Site safety and health;
- Chemical and Physical Hazards present on the site;

- Work practices by which risks from hazards can be minimized;
- Detailed review of this HASP;
- Safe use of engineering controls and equipment on the site;
- Use of Personal Protective Equipment; and
- Medical surveillance requirements, including recognition of symptoms and signs which might indicate overexposure to hazards.

Site safety meetings will be held at least weekly to notify personnel of specific hazards, air monitoring results, changes in the HASP, or other topics determined by the HSO. Specific meetings will be held at the initiation of new or different field activities and at the time of any crew changes.

B.6.0 DECONTAMINATION PROCEDURES

Equipment decontamination will be conducted on site as appropriate. Equipment decontamination will consist of physically removing visible contamination from contact points of the equipment at completion of work tasks and before leaving the work area.

Personal decontamination will consist of removing and leaving outer PPE at the work zone and good personal hygiene. Employees will be required to wash with soap and water at each break and lunch period and at the end of the work shift.

A temporary staging area will be set up at the perimeter of the work zone. Outer PPE (rubber boots, gloves and washable coveralls) will be removed and will remain in the staging area. The staging area will have facilities for washing exposed skin. Workers and visitors will be required to pass through and use the staging area when exiting the work zone.

Decontamination procedures will be monitored by the HSO to determine their effectiveness. If such procedures are found to be ineffective, they will be altered to correct any deficiencies.

B.7.0 AIR MONITORING

Air monitoring will be conducted to evaluate the potential for employee exposure and to determine the overall contribution of work activities to ambient air quality. Prior to any activities on site, background air samples will be collected around the perimeter of the work zone and repository. During placement activities, qualitative and quantitative air sampling will be conducted to determine employee exposures. All air samples will be collected and analyzed according to the appropriate National Institute of Occupational Safety and Health (NIOSH) method for determining concentrations of

arsenic, lead, and total suspended particulates (TSP). (See Appendix A to the Work Plan).

B.7.1 Occupational Air Monitoring

Quantitative personal samples will be collected using Gilian constant-flow pumps calibrated using a rotameter or "bubble tube" to draw between 1.0 and 2.0 liters of air per minute. The samples will be handled under chain-of-custody procedures and delivered to a qualified laboratory for analysis. (See Appendix A to the Work Plan)

Employees with the highest potential for exposure will be selected for personal monitoring. At the start of field activities and periodically thereafter, occupational air samples will again be collected and analyzed for arsenic, lead and TSP. Additional air monitoring will be conducted whenever there is a change in work conditions which can be expected to result in new or additional exposure levels or whenever an employee complains of symptoms which may be attributable to exposure to lead or arsenic.

Qualitative work zone air monitoring will be conducted using real-time instruments which measure the light-scattering effect of particulates.

B.8.0 MEDICAL SURVEILLANCE PROGRAM

A medical surveillance program provides a means of selection of employees who are physically able to safely perform the work assigned and monitor their health on a regular basis. The medical surveillance program to be implemented for this project will comply with 29 CFR 1910.120(f).

The program consists of a pre-employment medical evaluation to determine fitness for the job assignment, an annual evaluation based on length of assignment, and an end-of-employment evaluation. In addition, a special evaluation is warranted when an employee indicates that they may have developed symptoms resulting from a possible exposure to hazardous substances.

Medical surveillance will be conducted for all Site personnel who may be exposed to arsenic and lead in excess of PELs, without regard to the use of respirators, for 30 days or more per year. All personnel participating in the medical surveillance program will have an examination which equals or exceeds the following:

- Medical and Occupational History;
- Physical Examination;
- Pulmonary Function Test;
- Six Frequency Audiogram;
- Urinalysis, with microscopic morphology and dipstick;

- Complete Blood Count;
- CHEM 20 Chemistry Screen;
- SAM 10 Drug Screen;
- Chest X-Ray; and
- Blood lead and 24-hour urine arsenic levels

All contractor personnel with the potential for chemical exposure are required to have medical monitoring which equals or exceeds this program. Visitors and regulatory personnel who will enter the work area may be required to demonstrate participation in a medical program which is equivalent to or exceeds this program. The Health and Safety Officer will determine which personnel must meet training and medical-monitoring requirements.

Prior to the start of project activities, all employees with potential for exposure will have a baseline evaluation conducted for lead levels in blood and urine arsenic levels. These evaluations are to be repeated at the completion of work activities or end of employment, as deemed necessary by the Health and Safety Officer.

Copies of the physician's written opinion for the capability of the individual to work in areas with a potential for arsenic and lead exposure and the ability to wear a respirator will be maintained by the Health and Safety Officer for all workers on Site.

B.9.0 STANDARD OPERATING PROCEDURES/SAFE WORK PRACTICES

Standard operating procedures and safe work practices for this project consist of Kennecott General Safety for Contractors in addition to the following:

- No alcohol, firearms, or illegal drugs will be allowed on Site. Anyone reporting to work under the influence of alcohol and/or illegal drugs will be discharged immediately.

- Any employee under a physician's care and/or taking prescribed medication must notify the Site Health and Safety Officer.

- Eating and drinking are allowed only in designated areas and never in the removal work zone or at the dump site.

- All personnel shall listen for warning signals on construction equipment and shall yield to construction equipment.

- All equipment operators shall pay careful attention to workers on the ground who may be in their path and provide warning to these people before moving. All employees working regularly on the ground will wear

orange vests with reflective tape. Operators shall also pay deliberate attention to all types of utility lines and sources.

- All personnel are required to be familiar with and abide by the security rules, and emergency procedures.

- All personnel must report any injuries, vehicle accidents, and/or illnesses to their supervisor. This includes minor slight injuries.

- All prospective employees must pass a pre-employment physical and subsequent exams as required by this plan. Failure to submit to, or pass, any exam will be grounds for dismissal.

- All personnel must participate in the air-quality exposure monitoring program by wearing personal monitors or sampling devices designated by the Site Health and Safety Officer. Any personnel refusing to participate in the program, or who tamper with the sampling devices, will be subject to disciplinary action or expulsion from the Site.

- All personnel must abide by all safety rules and procedures as described in the work rules and/or throughout the project.

APPENDIX C:
SOIL SAMPLING & ANALYSIS PLAN

APPENDIX C
SOIL SAMPLING AND ANALYSIS PLAN

C.1.0 INTRODUCTION

Following removal activities in Bingham Creek Channel on Holy Cross Hospital property, soil will be sampled and analyzed to document lead and arsenic concentrations. Composite soil samples will be collected and quantitatively analyzed. The sampling program for quantitative analysis is designed to fulfill the data requirements of the removal action which includes:

- The samples collected are representative of the materials sampled;
- Sample integrity is maintained and documented;
- Proper measurements and information are recorded;
- Sample volumes are sufficient for the required analytical procedures;
- Analytical results adequately characterize soil; and
- The sampling protocol is efficient and relatively uncomplicated.

C.2.0 POST-REMOVAL SAMPLING PROCEDURE

The following sections outline the standard operating procedure (SOP) to be followed in conducting sampling for quantitative analysis. The site-specific Health and Safety Plan will be complied with at all times during sampling.

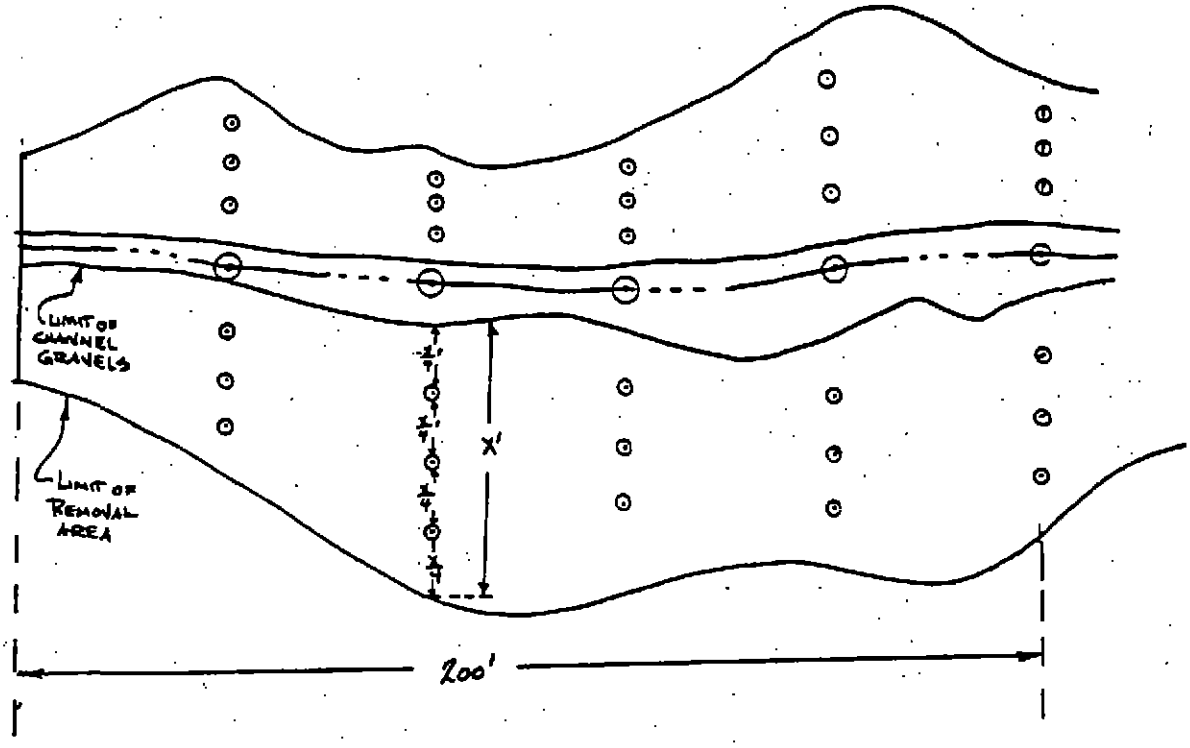
Two types of composite samples will be from the post-removal area. One composite sample will be collected along the center line of the channel consisting of five subsamples. The other composite type, for both channel banks, will consist of 15 subsamples. This sampling plan was developed to provide adequate coverage for the tailings removal areas disturbed be excavation equipment. The subsample locations are described below.

C.2.1 Sub-Sample Locations

The sample cells will be 200 feet long and the width will be equal to the widest distance of the removal area. Five parallel lines will be spaced over the 200 foot cell at 40 foot intervals. A channel axis line will be established at the centerline.

The channel axis composite sample will be generated from five, preselected subsample locations in the channel bottom. The subsample locations will be at the intersection of the channel axis line and the 40 foot

interval line. These five subsamples will be composited to generate the channel bottom composite sample (see diagram).



The channel bank composite subsamples will be collected along the 40 foot interval line at preselected points. If the channel bank width is X feet, three subsample locations will be collected at 1/4 X (see diagram). For each channel bank sample, 15 subsamples will be composited.

For each 200 foot cell, three samples will be collected: two channel bank samples and one channel axis sample. The total number of sample cells will depend on the total length of channel to be sampled. The last sample cell will be adjusted, if necessary, to provide coverage for all removal areas.

The sample locations will be located in the field using tape and compass methods and each sample will be referenced to existing points on Holy Cross Hospital property.

C.2.2 Sample Collection

The soil samples will be collected using disposable plastic or hand tools. The quantity of material sampled at each sub-site will be approximately 1/4 to 1/2 lbs. Soil samples will be collected from the top 4 inches at the sampling location.

C.2.2.1 Generation of Composite

Sample containers will be 12" x 17" polyethylene bags. Each bag will be taped closed after sample collection and compositing. Composite sample mixing will occur by thoroughly shaking the sample in a vertical and horizontal motion.

C.2.2.2 Sampling Sequence

The following sequence of events will be followed for all collected soil samples.

1. Fill out logbook header at the beginning of the day;

2. Document initial information about the individual samples and conditions in a field logbook, including a map or diagram;

3. Label container with sample number, date, time, any comments, and samplers' initials;

4. Collect the sample. As a precautionary measure always collect twice the required sample volume;

5. Place soil samples in separate sample containers.

6. Record sample description in the field logbook; and

7. Ensure required duplicates (10%, i.e.-every tenth sample), are included.

At days end:

8. Prepare chain-of-custody forms for all samples;

9. Package and ship samples, including chain of custodies.

Each sequence event is described in detail in the following sections.

C.2.2.3 Logbook Header

An up-to-date sampling field notebook will be maintained by on-site personnel during all sampling activities. The general information recorded for each days' sampling event includes:

- Date;
- Name of overall sampling event
- Sampling personnel; and
- Climatic conditions;

C.2.2.4 Logbook Sample Entries

QA/QC procedures for soil sampling require completion of a Field Sampling Log. For each sample collected, the logbook must contain:

- sample number;
- location;
- time;
- sampling method;
- field observations; and
- a map or diagram.

Significant deviations from sampling protocol should be formally noted in the field log, along with visiting personnel and unusual circumstances which might affect the sampling.

C.2.2.5 Container Label

To prevent misidentification of samples, each sample container will be affixed with a label. Labels will be written with indelible ink and will be sufficiently durable to remain on the container. The following information will be recorded on the sample container:

- Sample identification number;
- Name of sampling personnel;
- Date and time of collection; and
- Location.

C.2.2.6 Decontamination

All non-disposable sampling equipment will be cleaned when moving to a different sampling point to prevent cross-contamination. All samples will be collected with disposable plastic spoons. In the event if hand tools are needed, the equipment decontamination procedures are as follows:

1. Remove gross contaminants;

2. Wash with Algonox or other lab soap;

3. Rinse with tap water;

4. Triple-rinse with deionized water;

5. Repeat all or part of the procedure, if necessary.

Field personnel conducting the equipment decontamination and sampling will be required to wear protective gloves and the personnel protective wear required under the HASP. The decontamination procedures used will be recorded in the field logbook.

C.2.3 Chain-of-Custody

Chain-of-custody forms should be available in the field. If for any reason, the sampling foreman must leave, he should sign off of the chain-of-custody form and his assistant or replacement should sign on and assume responsibility for sample custody.

To establish the documentation necessary to trace sample possession from the time of collection, a chain-of-custody record will be filled out and accompany every set of samples. The record will include the following:

- List of sample numbers;
- Signature of collector;
- Date and time of collection;
- Sample types;
- Number of containers;
- Parameters requested for analysis for each sample;
- Signature of person(s) involved in the chain of possession; and
- Inclusive dates of possession.

C.2.4 Sample Packaging and Shipping

Sample preparation and packaging will be conducted in clean areas that are remote from potential contaminant sources. The soil samples will be secured in shipping containers. Packing material will be provided to stabilize the shipping containers if necessary.

Samples will be delivered to the laboratory daily. In cases where samples will leave the immediate control of project personnel, a seal will be affixed to the sample container to ensure that the samples have not been disturbed during storage or transportation. The integrity of the seal will be observed and documented upon arrival at the laboratory.

C.2.5 QA Objectives

The purpose of data quality assessment is to assure that data generated under the QA program is accurate and consistent with program objectives. The quality of the

data will be assessed based on precision, accuracy, and completeness. Precision is the degree to which a measurement is reproducible and will be assessed by a review of duplicate analyses. Accuracy is a determination of how close the measurement is to the true value and will be assessed via spike recovery in sample matrices. Completeness is a measure of the amount of valid data obtained, compared to the amount that was expected under normal conditions. Ninety-five (95%) percent completeness is the goal of this removal action. The project data objectives for precision, accuracy, and completeness are consistent with guidelines established by the EPA Contract Lab Program.

C.2.6 QA/QC Samples

Ten percent of all samples will be split and analyzed at a second lab. The analysis comparisons will be made to ensure accurate and reproducible results are ascertained from each laboratory.

One decontamination rinsate sample will be collected for ten percent of all soil samples collected.

C.2.7 Analytical Method

The soil samples will be analyzed for lead and arsenic according to EPA Methods. The soil samples and splits will be analyzed at two Certified Environmental Laboratories in Salt Lake City, Utah.

All analytical procedures will be consistent with federal guidance Solid Waste (SW) - 846 (test methods for evaluating solid waste).

C.2.8 Data Reduction, Validation, and Reporting

All data will be reported in appropriate units. All raw data will be reviewed and validated against calibration records to ensure that data are reliable, and that data are in compliance with QA/QC objectives. Upon completion, a copy of the signed laboratory report will be submitted to the appropriate agency for review.

Raw data from field measurements and sample collection activities that are used in project reports will be appropriately identified.

QC records showing accumulated precision and accuracy data will be maintained in the laboratory and reported along with analytical results. Poor quality results require that the problem be determined and corrected.

C.2.9 Corrective Action

If QC results detect conditions or data that do not meet QC requirements, corrective action will be initiated. The nature of the action will depend on the circumstances unique to each situation and may include:

- Reanalyzing the samples, if holding time criteria permit;
- Resampling and analyzing;
- Evaluating and amending sampling and analytical procedures; and
- Accepting data, acknowledging level of uncertainty.

TRENCHING AND SAMPLING IN BINGHAM CREEK AT THE HOLY CROSS JORDAN VALLEY HOSPITAL SITE

TRENCHING AND SAMPLING IN BINGHAM CREEK AT THE HOLY CROSS JORDAN VALLEY HOSPITAL SITE

1.0 INTRODUCTION

Construction activities are currently underway at Holy Cross Jordan Valley Hospital in West Jordan, Utah, to expand the facility. The hospital property includes a 1050' section of Bingham Creek in the area of 9000 South and 3600 West. A previous EPA investigation of Bingham Creek at the hospital site has indicated elevated levels of lead and arsenic in surface soils. In anticipation of a removal action, a trenching, sampling, and analysis program was conducted by Kennecott in order to estimate the volume of material needed to be removed to accommodate the hospital expansion plans.

On February 19 and 20, 1992, 20 soil samples were collected from fourteen trenches excavated in Bingham Creek on the hospital property. The samples were analyzed for lead and arsenic concentrations at Ford Chemical Laboratory in Salt lake City, Utah.

The samples were assigned the identification numbers HC-1 through HC-20.

A rubber-tired backhoe contracted from W. W. Clyde, was used to excavate the trenches.

Personnel present during trenching and sampling activities were as follows:

Keith Smith, Envirocon representing Kennecott
Larry Elkin, North American Exploration representing Kennecott
Bud Henderson, Kennecott
Ron Segura, Bureau of Reclamation representing the EPA

2.0 LOCATION AND DESCRIPTION

Holy Cross Jordan Valley Hospital property is bounded on the south by 9000 South Street and is located at approximately 3600 West, (See Attachment A, Location Map). Bingham Creek trends SW to NE through the southeast corner of the property for approximately 1050' in length. Hospital expansion plans includes landscaping adjacent to and in Bingham Creek.

The downstream, northeast part of Bingham Creek is incised 5' to 10' and is 75' to 110' across its floodplain. The upstream, southwest end of the creek is narrower, approximately 50' across and is incised 10'.

3.0 TRENCHING

A total of 14 trenches were excavated using a rubber-tired backhoe. Trench locations were arranged in a linear fashion trending perpendicular to the channel axis. The depths of excavation were guided by visual examination. Steeper topography and vegetation prevented backhoe access to the southwest, upstream portion of the creek.

4.0 SAMPLING COLLECTION

A total of 20 samples were collected from fourteen trenches. The samples were assigned the identification numbers HC-1 through HC-20. Samples were collected from visible tailings and material suspected of being natural and in place. Please refer to Table 1 for a complete list of sampling and analytical data.

5.0 SAMPLING PROCEDURES

Sample material was collected from trenches using the following procedure:

- Loose material from the desired sample interval was scraped from the trench wall until undisturbed material was exposed;
- A decontaminated plastic trowel was used to scrape sample material from the wall and place it directly in a 9" x 15" polyethylene bag;
- The bag was secured shut with a plastic-coated wire twist-tie;
- The bag was labeled with the following information:

    - Sample identification number
    - Collection date
    - Samplers initials

Due to greater depths, sample material for HC-6, HC-7 and HC-18 was excavated from the trench by instructing the backhoe operator to scoop material from the desired interval and place it on the ground in a separate pile. The sample was collected from the pile using the aforementioned procedure.

Trench sites were located on a 1" = 75' scale map in the field. A tape measure was used to measure from locatable landmarks to the trench. A log was compiled of each trench in the field logbook.

6.0 DECONTAMINATION PROCEDURES

The plastic trowels used to collect the samples were decontaminated before use, using the following procedure:

- Brush gross contaminants off with nylon bristled scrub brush;
- Wash with alconox and tap water;
- Triple rinse with tap water;
- Triple rinse with deionized water;
- Dry with paper towel;
- Place in polyethylene bag and seal.

7.0 QA/QC

A duplicate sample was collected from sample HC-10 and will be delivered to American West Analytical Laboratory on February 24, 1992.

8.0 ANALYSIS AND RESULTS

Samples were delivered to Ford Chemical Laboratory in Salt Lake City for analysis of lead and arsenic. EPA Method 3050 was used for sample preparation. The results of analysis are listed in Table 1.

9.0 DOCUMENTATION

Documentation procedures included the following:

- Field logbook notes
- Photographs
- Labeling of sample containers
- Chain of custody forms

Field notes, photographs and chain of custody forms are included in Attachments B, C, and D respectively.

TABLE 1. SAMPLING AND ANALYTICAL DATA FROM BINGHAM CREEK AT HOLY CROSS JORDAN VALLEY HOSPITAL SITE.

TRENCH NUMBER	SAMPLE I.D. NUMBER	SAMPLE DEPTH	ANALYTICAL RESULTS (ppm)	
			Pb	As
1	HC-1	1.0' - 2.1'	67.380	6.263
1	HC-2	2.0' - 4.0'	120.380	10.152
2	HC-3	5.0' - 6.0'	553.390	22.511
2	HC-4	6.4' → 7.5'	9906.050	260.685
3	HC-5	2.0' - 3.0'	172.280	22.971
4	HC-6	6.0'	7721.800	113.338
4	HC-7	10.5' → 11.0'	1261.070	108.190
5	HC-8	2.5' → 3.0'	108.190	8.937
6	HC-9	2.3' - 3.3'	139.260	19.961
7	HC-10	3.8' - 4.2'	200.16	21.517
7	HC-11	2.5' - 4.0'	4435.120	130.872
7	HC-12	1.6' - 2.0'	7662.210	331.847
9	HC-13	2.3' 2.7'	218.260	20.304
10	HC-14	3.0' - 4.0'	192.850	21.263
11	HC-15	2.6' - 4.0'	74.960	13.586
12	HC-16	2.7' - 3.5'	8343.100	310.081
12	HC-17	4.0' - 5.0'	232.050	15.470
12	HC-18	2.5' - 3.5'	12858.280	231.548
13	HC-19	3.0' - 4.0'	149.330	19.409
14	HC-20	2.5' - 3.5'	183.270	20.501

Feb. 19, 1992 L. Elkin.

Ron Segura Bureau of Rec. / EPA

Sample collection Procedures:

- Sample material will be scraped free of loose material, so in place material is exposed.
- Sample material will scraped from wall of trench using decontaminated plastic trowel.
- Sample material will be placed directly in 9"x15" polyethylene bag.
- Bag will be secured shut with a plastic coated twist tie.
- Sample bag will be labeled with the following information:
  - sample I.D. number
  - date of sample collection
  - samplers first initial and last name.

Feb 17, 1992 LARRY ELKIN
Larry Elkin

Trenching and Sampling of Holy Cross Hospital Site

Purpose: To trench and collect samples in order to define extent of contamenated material in Bingham Creek channel/floodplain. This will be used to estimate volume of material to be removed from area.

Samples will be analyzed for lead and arsenic at Ford Chemical Laboratory in S.L.C. EPA method 3050 preparation will be used prior to analysis.

Rubber tired backhoe will be used to excavate trenches. Backhoe contracted from W.W. Clyde

On site Personnel:
Keith Smith: Envircon
Larry Elkin North American Explor.
Bud Henderson: Kennecott

- A total of 20 samples were collected from 14 trenches. Samples were assigned the identification numbers HC-1 through HC-20.

- Samples HC-1 thru HC-18 were delivered to Ford Laboratory on February 19, 1992. Samples HC-19 & HC-20 will be delivered Feb 20, 1992
- Photographs were taken at each site.

- Sample sites were located on a field map, (scale 1" = 75'). Each trench location was measured to a landmark in the field or adjacent trench

- Sample intervals were measured with tape measure from existing ground surface

- one QA/QC sample/duplicate was collected for HC-10.

A split of sample HC-4 was made for Ron Segura. Two

Feb. 20, 1992
L. Elkin

samples were collected from HC-18 material as another split for Ron Segura. Ron Segura picked up splits at PPG from L. Elkin at ≈ 12:45 PM Feb. 20, 1992.

7/29/92	127.3	9.2	139.0
7/29/92	121.2	12.2	136.0
AVERAGE	118.6	10.7	131.2

Note: all testing conducted by SH&B in Bluewater I Repository.
Water was added to the material in the Repository to acheive 95% compaction.
Data from the truck scales is representative of the material hauled prior to the addition of water, so the dry density of the material will be used to calculate the conversion factor from pounds to yard hauled.

Conversion factor = 3202 lb/cu. yd.

Attention: Ms. Richelle Golightly

Re: Summary Report
Moisture/Density Tests
Holy Cross Jordan Valley Hospital
West Jordan, Utah
for Kennecott Plant Projects Group

Dear Ms. Golightly:

Submitted is a summary of in-situ moisture/density tests performed during the period of August 12, through August 24, 1992 at the referenced project. Testing was performed on bank-run backfill material placed and compacted by Glen's Excavation within the Bingham Creek Channel. Testing was performed at the request of Ms. Richelle Golightly and Mr. Roger Hall of Kennecott Plant Projects Group. Also submitted is a plot of the moisture/density relationship (proctor) utilized as the maximum in determining percent compaction.

Should you have any questions with regards to this submittal or if we may be of further assistance, please contact the undersigned.

Respectfully submitted,
SHB AGRA, Inc.

BINGHAM CREEK POST REMOVAL SAMPLING
ON
HOLY CROSS JORDAN VALLEY HOSPITAL PROPERTY

1.0 INTRODUCTION

Kennecott has recently completed a tailings removal operation in Bingham Creek on Holy Cross Jordan Valley Hospital property located immediately north of 9000 South between approximately 3500 West and 3800 West. Tailings in the creek channel had been sampled previously and were known to contain elevated levels of lead and arsenic. The tailings were excavated and transported to the Bluewater I Repository located on Kennecott property. As written in the SAP, post-removal samples were collected in order to document lead and arsenic concentrations of the underlying soils.

The soils were collected by Larry Elkin and Steve Schnoor (North American Exploration) between July 10 and July 30, 1992. Glen's Excavating Company was contracted to excavate, transport, and recontour the removal area.

Tom McCarl and Ron Segura (Bureau of Reclamation representing the EPA) were on site during much of the removal and sampling activities.

Samples were analyzed for lead and arsenic concentrations at American West Analytical Laboratory. One split sample was analyzed at Ford Analytical Laboratory as part of the QA/QC procedures.

2.0 LOCATION AND DESCRIPTION

Holy Cross Jordan Valley Hospital is located immediately north of 9000 South between approximately 3500 West and 3800 West. Bingham Creek trends SW-NE for approximately 1100' through Hospital property, (See Appendix D, Sample Location Map).

The creek is incised approximately 5' to 10'. Grassy vegetation exists on the north side of the creek and small to large trees on the south.

Tailings in Bingham Creek were observed to varying depths below the pre-removal surface ranging from 2' at the southwest end to approximately 10' at the northeast end. The tailings appears to have been deposited by water in a v-shaped channel with natural alluvial gravels underlying the tailings and sand, silt, and clay deposits of probably lacustrine origin on the sides. The tailings

are generally silt, sand and fine gravel and have a distinct yellow color. Underlying the tailings is a transition zone of tailings mixed with natural alluvium. Red iron oxidation is moderate to strong in and below the transition zone. The tailings were observed to taper towards the shoulders of the channel and to dip steeply near the center of the channel.

3.0 SAMPLE COMPILATION

A total of 10 samples were collected. The samples were assigned the following identification numbers:

HCX-1
HCX-2
HCX-9 Thru HCX-16

4.0 SAMPLING PROCEDURES

4.1 Samples HCX-1, HCX-2, HCX-9, HCX-10

Samples HCX-1, HCX-2, HCX-9, and HCX-10 were 5-point composite samples collected from the southwestern two-thirds of the removal area. Each composite sample consisted of 5 subsites located by random number generation. Each composite sample was collected from within the boundaries of a composite cell. The length of each cell (along channel axis) was 150' and the width was equal to the widest distance of the removal area (perpendicular to channel axis) for that particular length of channel. Subsite locations, randomly generated that were outside the removal area, were skipped and the following random numbers used until 5 subsites were located within the removal area. Some subsite locations were skipped or moved if random number generation did not provide adequate coverage. This was done by the EPA's (Ron Segura's) suggestion.

Each subsite consisted of material collected from 4-points located symmetrically around the actual subsite (1 foot) and also including the subsite. The subsites were located in the field using a measuring tape and a hand held compass.

Loose material was scraped away from the surface of the subsite area until undisturbed soils were exposed. A decontaminated plastic trowel was used to collect the sample material from the 0" to 4" below surface

interval. An equal amount of sample material was collected from each subsite. The sample material was placed in a 12" x 18" polyethylene bag and secured shut with tape. The sample bag was labeled with indelible ink and included the following information:

- Sample identification number
- Collection date
- Samplers initials

Sample material was homogenized by stirring and chopping in a stainless steel bowl. Sample splits were made of all samples collected after homogenization and given to either Tom McCarl or Ron Segura.

Chain of custody was maintained for all samples collected. Chain of custody forms are included in Appendix B.

4.2 Samples HCX-11 Thru HCX-16

Samples HCX-11 thru HCX-16 were collected from the northeastern third of the removal aea. This area covers 270' along channel axis and was divided into 2 zones. The south-western zone was 150' long (parallel to channel axis) and the northeastern zone was 120' long. Three composite samples were collected from each zone.

One composite sample from each zone was collected along the centerline of the channel and consisted of 5 subsamples evenly spaced from one end of the zone to the other end.

A 15-point composite sample was collected from each of the two channel bank areas per zone. Subsite locations were determined by the following procedure:

A line, perpendicular to channel axis, was established at each of the channel bottom subsite locations using a compass. The area along these lines outside the channel gravels to the limit of the removal area, was divided into 4 equal parts (this distance varied at each location). Each of the 3 interior diversion points were the subsite locations.

At each subsite loose material was scraped away until undisturbed ground was exposed. The sample material was collected using a decontaminated plastic trowel from the 0" to 4" below surface interval.

An equal amount of sample material was collected from each subsite. The sample material was placed in a 8" x 12" polyethylene bag and labeled including the following information:

- Sample I.D. Number
- Collection date
- Sampler's initials

The samples were homogenized by stirring and chopping in a stainless steel bowl. After homogenization, samples were split. Splits of all samples were given to Tom McCarl (Bureau of Reclamation).

Chain of custody was maintained for all samples collected. Chain of custody forms are included in Appendix B.

5.0 DECONTAMINATION PROCEDURES

Plastic trowels and stainless steel bowls used in the collection process were decontaminated prior to use by the following procedure:

- Brush gross contaminants off with nylon bristled scrub brush;
- Wash in alconox soap and tap water;
- Triple rinse in tap water;
- Triple rinse in deionized water;
- Dry with paper towel;
- Place in polyethylene bags and seal

6.0 ANALYTICAL RESULTS

All samples were analyzed for lead and arsenic concentrations. Samples were analyzed at American West Analytical Laboratory in Salt Lake City. One QA/QC sample (split sample) was collected and analyzed at Ford Analytical Laboratory also located in Salt Lake City. Laboratory analytical sheets are included in Appendix B. The results of analysis are listed in Table 1.

7.0 DOCUMENTATION

Documentation procedures included the following:

- Field notes (Appendix A)
- Chain of Custody Forms (Appendix B)
- Photographs (Appendix C)
- Labeling of sample containers

TABLE 1:
ANALYTICAL RESULTS

Post Removal Sampling at Holy Cross Jordan Valley Hospital

Holy Cross Jordan Valley Hospital is located at 9000 South and west. Bingham Creek is located on the southern portion of Hospital property and trends SW-NE through the property for approximately 1100'.

Mine Tailings have been deposited in the Bingham Creek channel on Hospital property. The tailings will be removed and post removal samples will be collected in order to characterize and document the soil to be disposed of after removal.

Removal operations began on June 1, 1992 at the SW end of Bingham Creek. Kennecott is carrying out the removal operation. Glenbs Construction has been contracted the perf by Kennecott to perform

the removal operation. Tailings will be hauled from the hospital and placed on a repository on Kennecott property approx ½ mile South of Copperton, Utah (Bluewater I Repository).

On site personnel:

- Project Manager Richele Golightly (Kennecott)
- Samplers: Larry Elkin (North American Explor.)
  Edward Grafton (Contracted by Kennecott)
- Glenn Comstock (Contracted by Kennecott)
- Tom McCash (Bureau of Reclamation) representing EPA and overseeing removal operation.

July 2, 1992
Began removal at 7:00 AM Partly cloudy
Cool Ground is damp from yesterdays rain.

11:30 AM Took 2 photos at excavation looking SW. Culvert at SW end of Hospital Bingham Creek on hospital property. 900' South beyond embankment. Roll A - #1, #2. Tailings and natural ground visible in photos. Tailings yellow brown clay sand dipping towards culvert. Iron stained gravel below tailings.

Left site at 11:30 AM

JULY 10, 1992 Friday
LARRY ELKIN Larry Elkin

Post Removal Sampling
Bingham Creek at Holy Cross
Jordan Valley Hospital

- Purpose: To characterize (Pb and As concentrations) and document (by sampling and analysis) soils after removal of tailings from Bingham Creek.

- Samplers: Larry Elkin, ~~xxxxx~~ North American Exploration, representing Kennecott.

- On site personnel:

At the present time the first 150' of Bingham Creek has been removed of tailings. The first post removal sample will be collected. This sample will be assigned the identification number HCX-1. The sample will be collected by procedures described in the SAP, as written below.

Sampling Procedure

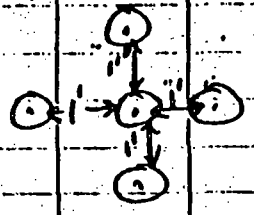
One, 5-point composite sample will be collected from the removal area of the first 150' of Bingham Creek, (Starting point at NE end of culvert under 9000 South) on Hospital property.

Five sample sites will be located by generating random

numbers representing locations

A random numbers chart, acquired from Ron Segura, Bureau of Reclamation, will be used.

Any point later generated by numbers chart falling outside the removal area will be skipped and the following point from the chart used until 5 locations within the removal area have been located. At each of the 5 sample subsites sample material will be collected and composited to form one sample. At each sample subsite material will be collected from 5 points located in the following configuration:



⊙ 1 aliquot

5 aliquots = one subsite

5 subsites = one sample

Sample material will be collected from the 0" to 4" below surface interval.

Before sample material is collected loose material from surface will be scraped away until undisturbed sample material representative of that point is exposed.

Sample material will be collected from using a decontaminated plastic trowel. An equal amount of sample material will be collected from each sample point. The sample material will be placed in a styrofoam cup (measuring cup) and then poured into one 12"x18" bag. When all the sample material

for a composite is collected the sample will be transferred to a decontaminated plastic stainless steel bowl and composited by mixing/chopping etc. until homogenization is achieved. The sample material will then be spooned (using trowel) in 3 separate bags. Each bag will be labeled the same (as follows)

HCX-1
7-10-91
L.E
SPLIT

One of the splits will be given to Tom McCall (Bureau of Reclamation). One of the splits will be delivered to American West Laboratory in SLC and analyzed for Pb and As. concentrations. The remaining

split will be delivered to Fast Analytical Laboratory in SLC as a QA/QC sample (analyzed for lead and arsenic).

Sample subsite locations were determined by the following generation of random numbers representing footage along x, y axis. The origin (0,0) was arbitrarily chosen to be the NW corner of the composite cell. The composite cell will be 150' long (y) and 73' wide (x). Seventy three feet is the widest distance of the removal area for the 150' length of stream channel.

0.45x = 32.85'	0.15y = 20.50'
0.55x = 40.15'	0.46y = 67.50'
0.35x = 25.55'	0.55y = 82.5'
0.85x = 62.05'	0.85y = 127.5'
0.05x = 3.65'	0.95y = 142.5'

Subsite locations were located in the field using sunto compass and measuring tape. Tom McCarl assisted in location of points

Sample descriptions

HCX-1

Subsite #1. Poorly sorted, sandy gravels. Large cobbles to silt. Predominately sand and pebbles. orange brown color and medium brown color. In bottom center of channel

Subsite #2 mixture of dark to medium brown and yellow brown silty sand. Poor sorted. Yellow brown may be lacustrine sediments Site located on south bank of excavation

Subsite #3 located in bottom center of channel Sandy gravel medium brown, cobbles to silt, predom. sand and small pebbles.

July 10, 1992
L. Elkin

(13)

Subsite #4 South side of channel Collected from well sorted sand. Light brown, orange and gray mottled color.

Subsite #5 located near top of removal boundary on north side of creek. Medium brown fair sorted, sandy, clayey, silt

(14) July 10, 1992 L. Elkin

Sample HCK-1 was collected from ≈ 8:30AM -> 9:45AM.

Samples splits were delivered to Ford Analytical Laboratory and American Wet Laboratory on July 10, 1992 AM.

A sample split was given to Tom McCarl at 9:40AM

Photographs were taken of sample HCK-1 area.

Chain of Custody Forms were completed for all samples.

(15)

(14) July 10, 1992 L. Elkin

Sample HCX-1 was collected from ≈ 8:30AM → 9:45AM.

Samples splits were delivered to Ford Analytical Laboratory and American West Laboratory on July 10, 1992 AM.

A sample split was given to Tom McCarl at 9:40AM

Photographs were taken of sample HCX-1 area.

Chain of Custody Forms were completed for all samples.

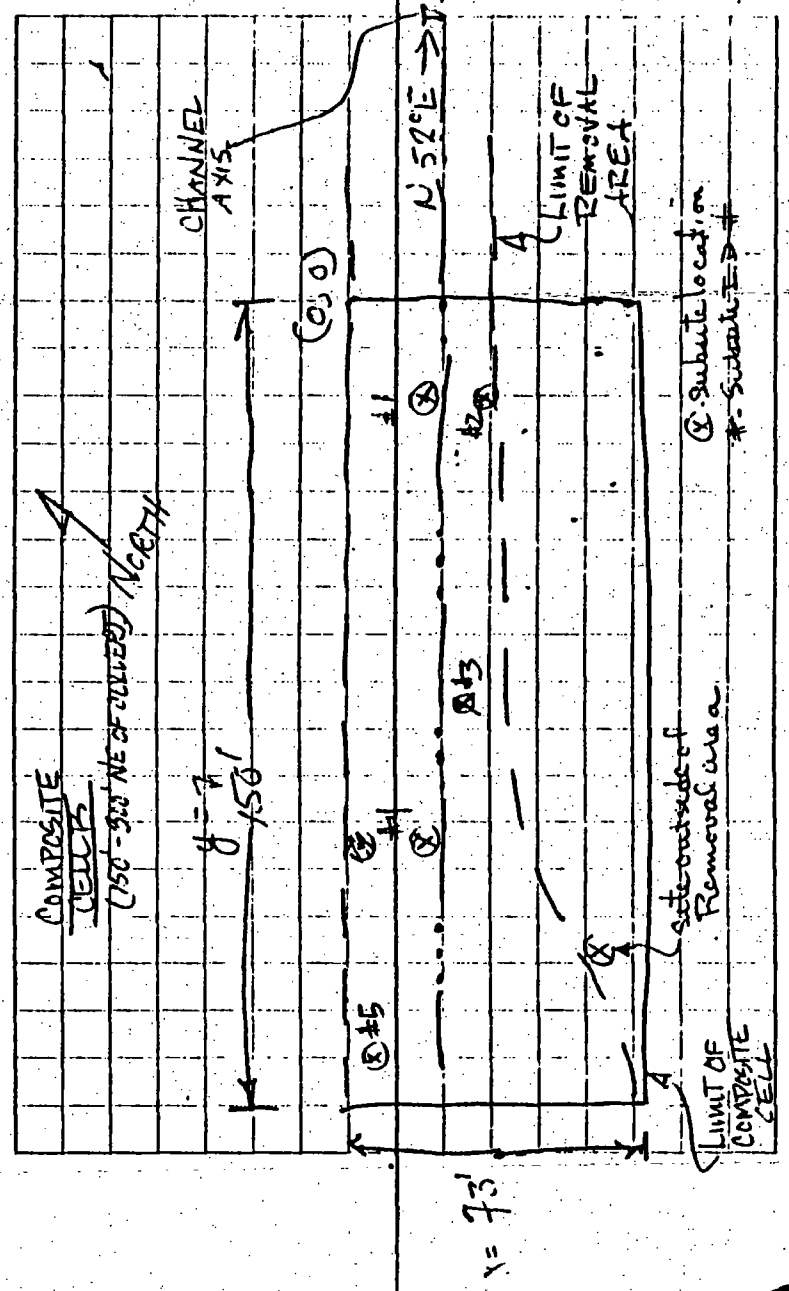
- Composite Cell B. (Adjacent to A) in downstream direction
- Composite Cell B is 73' wide (across drainage) and 150' long.
- This morning an irrigation ditch immediately South of Hospital property on the south side of 9000 South breached its banks and flowed west into Bingham Creek, water

then flowed downstream on Bingham Creek (under 9000 So.) and onto the removal area on Hospital property. The water pooled on the downstream end of the removal area, on at the time of sampling the bottom of the removal area was wet and a small pond approx. 2' deep and 40' long existed at the downstream end. Water from the irrigation ditch was no longer flowing at sampling time.

Sample subsets were randomly generated (as previously described pg 10 of the logbook). The (c, c) coordinate point was the north corner of the composite cell (clockwise from previous cell (1)).

0.45x = 32.85	0.15y = 22.50	outside removal area. skipped to extra sample points
0.55x = 40.15	0.45y = 67.50	
~~0.35x = 25.55~~	0.55y = 82.50	
0.85x = 62.05	0.85y = 127.5	
0.05x = 3.65	0.95y = 142.5	
0.15x = 11.15	0.15y = 22.50	



Sample descriptions HCX-2

Subsite #1 Center of channel bottom med. brown Sandy gravel, small cobbles to silt. Larger clasts qtzite and sandstone. Minor silt and clay.

Subsite #2 HCX-2, on south bank near top of removal area. - Med. brown to light brown fair sorted clayey silt. Organics

Subsite #3 HCX-2 collected from channel bottom. Med brown, and orange brown sandy gravel. Cobble to sand predom. qtzite pebbles. Minor silt and clay.

Subsite #4 HCX-2 collected from channel bottom (on north side) gravelly sand. Dog Orange Brown

Subsite #4 HCX-2 (continued) and med. brown. Predom. sand and small pebbles.

Subsite #5 HCX-2 north side, near top edge of removal area. Med to dark brown fair to well sorted clayey silt. Organics

---

Sample material was homogenized as previously described and a split was given to Tom McCarl (Bureau of Reclamation)

All sampling procedures were identical to those described earlier (See pages 5-10 of this log book)

The samples were delivered to American West Laboratory in Salt Lake City at approx 1200 PM

(20)

7-14-97 L. Elkin

Sample HCX-2 will be analyzed for Lead and Arsenic concentrations.

(21)

(28)

July 17, 1992 LARRY ELKIN

Larry Elkin

Continuation of post-Removal Sampling of Bingham Creek at Holy Cross Jordan Valley Hospital

On site Personnel
Rochelle Goldsby (Kennecott)
Keith Smith (Envirocon)
Ron Segura (Bureau of Reel./EPA)

Sampling procedures will be the same as previously described with minor variation on the randomly generated sample subsites.

By Ron Segura suggestion some sampling points generated by random numbers were rejected or modified in order to collect a "representative" sample. For example, if two points randomly generated fell in similar parts of composite cell,

7-17-92
L. Elkin

(29)

the second point was rejected or modified to ensure the subsites were from the entire cell.

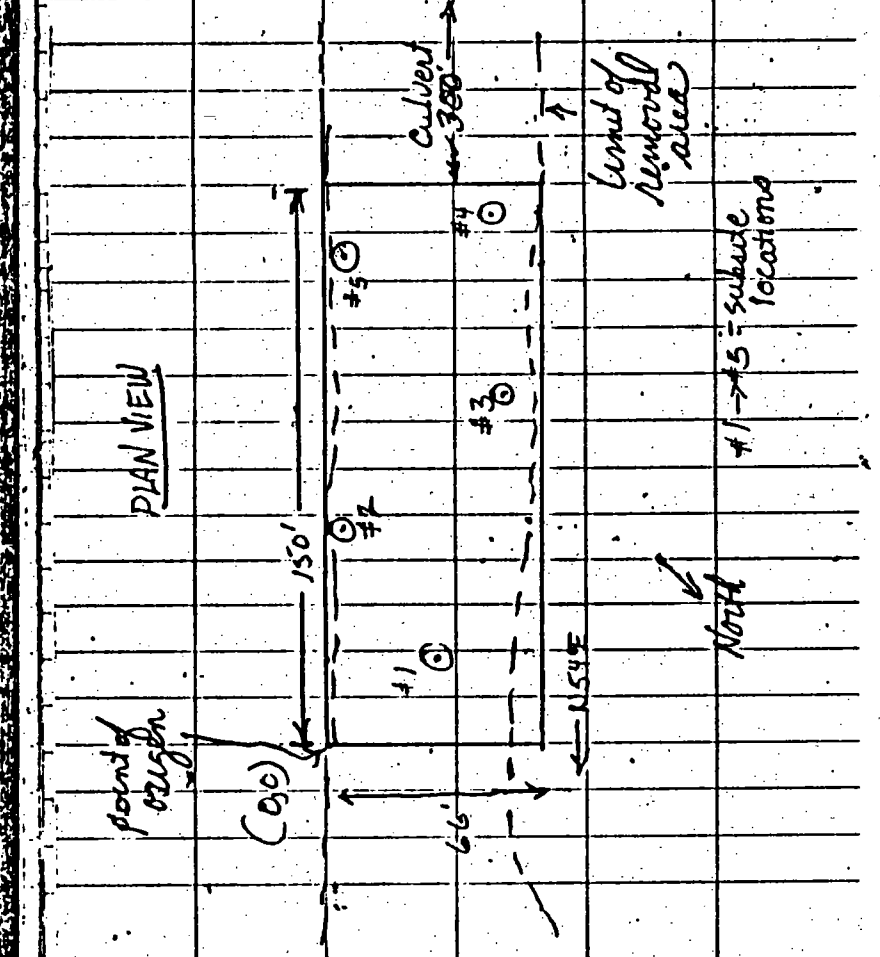
All other sampling procedures were as described previously in this field book.

~~So~~ Random numbers. Composite Cell C

Sample 116X-9 (5 point composite)

	X=66 Y=150'
0.45X = 29.7'	0.15y = 22.5'
0.85X = 56.1'	0.85y = 127.5'
0.20X = 13.2'	0.95y = 142.5'
0.70X = 46.2'	0.65y = ~~22.5~~ 97.5'
0.20X = 13.2'	0.40y = 60'

Sample HCX-7. Composite Cell C 66' wide x 150' long. 3rd Composite cell from culvert at SW end of property line



Sample Descriptions

HCX-7

Subsite #1. Gravelly sand small cobbles and pebbles comprise ± 35% matrix is predom sand & minor silt. med to light brown. Center bottom of channel

Subsite #2 near upper bank on south side. Clay silt. Dark to med brown. Organics

Subsite #3. Near channel bottom on north bank. Mostly dark brown to med. brown clayey silt. Minor sand.

Subsite #4 Halfway up bank on north side. Med to light brown clayey silt. Fair sorted.

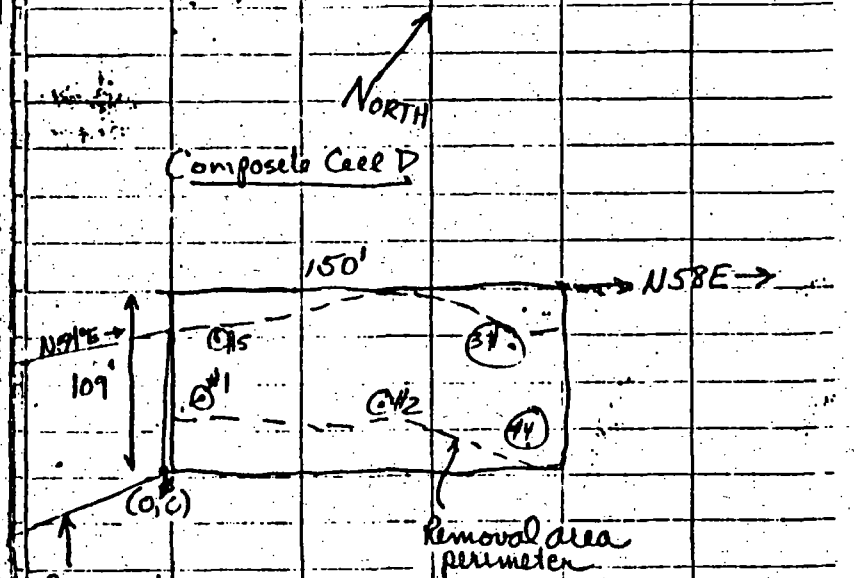
Subsite #5 near upper south bank. Fair to well sorted med brown clayey silt.

(32)

7-17-92

L Elkin

Sample HCX-10 (5-point composite)



Subsite	#1	0.45x = 49.05	0.15y = 22.5
"	#2	0.35x = 38.15	0.55y = 82.5
"	#3	0.70x = 76.3	0.85y = 127.5
"	#4	0.10x = 10.9	0.95y = 142.5
"	#5	0.75x = 76.3	0.15y = 22.5

7-17-92 L. Elkin (33)

Sample descriptions

HCX-10

Subsite #1, gravelly sand. Collected from bottom. Small cobbles and pebbles comprise ≤ 35%. In silty sand matrix, med brown to orange brown

Subsite #5 north bank 5' from top of removal area. med brown fair to well sorted clayey silt. Organics

Subsite #2 south side bottom, silty clay mottle orange brown to dark brown mod Fe-ox.

Subsite #4 south side upper bank well sorted sand, light brown.

Subsite #3. north bank, middle. med orange brown fair to well sorted silty clay

(34) 7-17-92 L. Elkin

Samples HCK-9 and HCK-10 were each homogenized by stirring in a stainless steel bowl. A split was made from each sample and delivered to Ron Segura's trailer (~8600 S. 3460 West), and

the other splits were delivered to American West Analytical Laboratory in S.L.C. at ~ 12:45 PM.

The samples will be analyzed for Pb and As concentrations

(35)

(36) 7-21-92 LARRY ELKIN

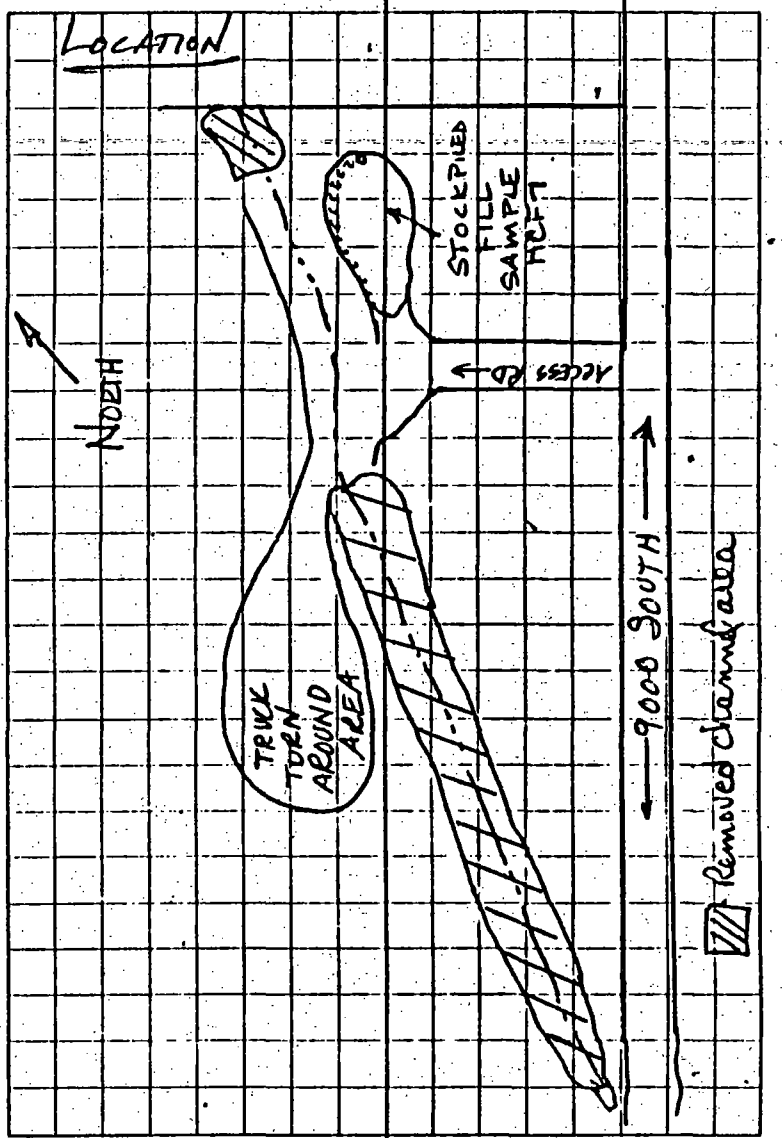
Continuation of Post-Removal Sampling of Bingham Creek at Holy Cross Jordan Valley Hospital

Removal operations are continuing. A stockpile of fill material is being placed near the NE end of Bingham Creek on Hosp Property (on south side of Creek)

A Sample of the stockpiled material will be collected and analyzed for Pb and arsenic concentrations.

Stockpiled fill material sample will be assigned the I.D.# HCF-1.

7-21-92 L. Elkin (37)



Sample Procedure

Stockpile is approx. 120' long and 40' wide. Sample was collected by sampling top 2", .5' up from bottom of pile, along NW side of pile. All 30 subsites were composited to form one sample. Sample was homogenized by shaking sample bag. Sample was then split. Bags were taped shut and labeled with the following information:

- I.D. #
- Collection date
- Samplers initials

(split sample also include "split")

Sample Description

Stockpiled appears fairly homogenous that being a

gravelly sand. Cobbles and pebbles comprise ≈ 35%. Matrix is predom. sand with minor silt. Light brown color. Largest clasts quartzite and sandstones.

- photos were taken of site

(40) 7-30-92 LARRY ELKIN
STEVE SCHNOOR

Continuation of Post-Removal Sampling at Bingham Creek on Holy Cross Jordan Valley Hospital.

On site personnal: Larry Elkin, (WAE) Steve Schnoor, (WAE) Tom McCall (Bureau of Rec.)

Samples HCX-11 → HCX-16

By suggestion of the EPA a different sampling plan will be used to sample the remaining removal area.

The sampling procedure for samples HCX-11 thru HCX-16 will be as follows:

The remainder of the sample area will be divided into 2 zones. Three samples will be collected from each zone. From each zone 2-types

7-30-92
L.E/S.S.

composite
of 15 samples will be collected.

One composite will be collected along the centerline of the channel consisting of five subsamples evenly spaced between opposite ends of the zone.

The other composite type (for both channel bank areas) will consist of 15 subsamples systematically placed on the banks. Subsample locations for bank samples will be determined by the following procedure:

Sandy 202
Brunton N39°E

(41)

At each of the channel axis subreaches the area outside the channel gravels to the limit of the removal area will be measured and divided into 4 equal parts. The

three interior points will be the subsample location. As the distance of the removal age varies at a sample area the points will be vary in order to symmetrically cover the sample area.

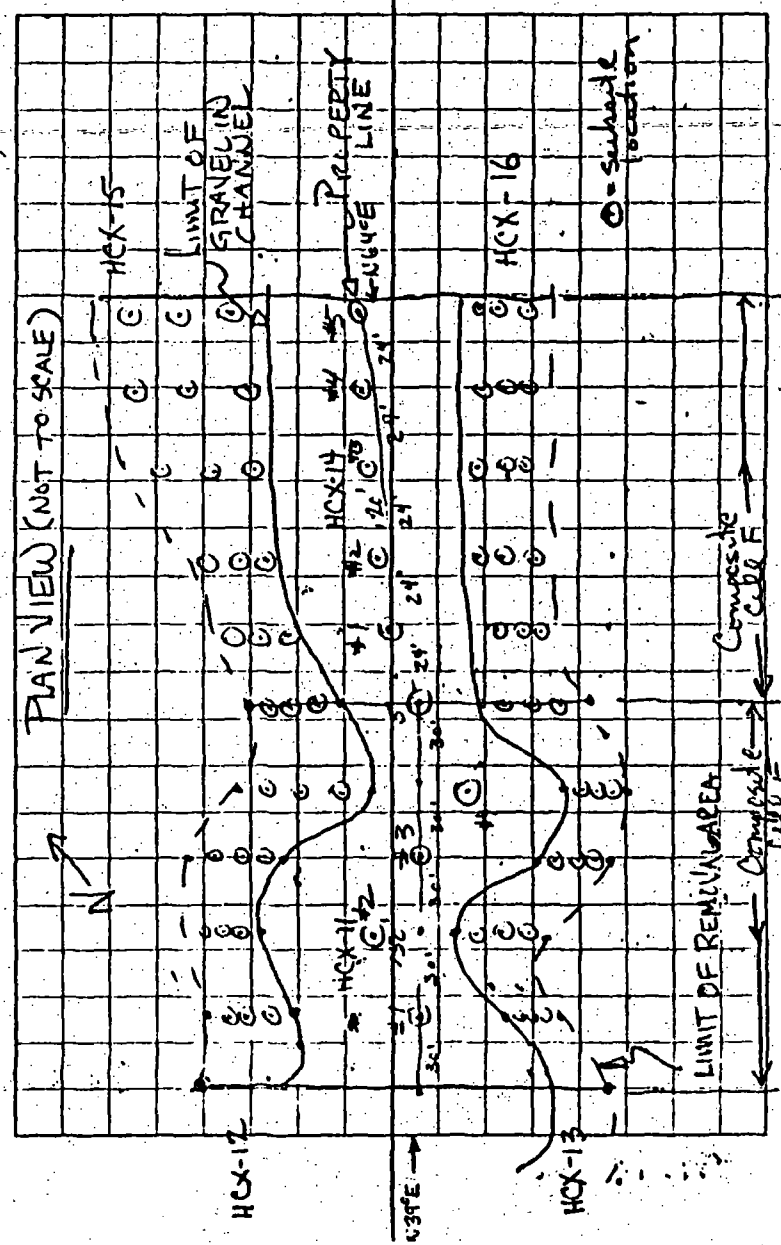
Each channel bank sample will consist of 15 subsamples.

The western-most zone will contain 3 samples. (this zone is 150' long)

Samples HCX-11 (Channel bottom)
HCX-12 (NW Bank)
HCX-13 (SE Bank)

The eastern-most sample zone (adjacent to property boundary) is 120' long and contains samples HCX-14 (Channel bottom)
HCX-15 (NW Channel bank)
HCX-16 (SE Channel bank)

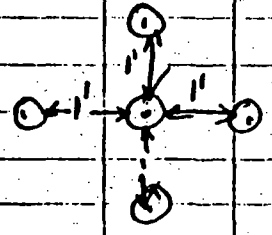
See diagram Pg 43 →



(44) 7-30-92 L. Elkin
S. Schnoor

A discreet sample will be collected from the channel bank samples.

At each of the 5 subsites of the channel bottom samples sample material will be collected ~~from~~ as diagramed below:



Approx. 4oz of sample material will be collected from all subsites (a plastic cup was used to measure sample amount)

A decontaminated plastic trowel was used to collect the sample material.

7-30-92 L. Elkin
S. Schnoor (45)

Sample Descriptions

5 rows of 3 sites each

HCX-13 15 subsites

Soil composition appears homogeneous - grayish sandy/silty clay

Lt. yellowish - red brown color. Note: all bottom samples were darker orange and sandier than samples toward top of row.

HCX-12

Row 1 bottom sandy/silty clay med orange - Brown - Loi - very sorted darker lacustrine sed at top.

Row 2

bottom sandy - orange color at base of Lo. Strap. Bank dark brown silty clay.

(46) 7-30-92 L. Elkin S. Schnoor

Samples were homogenized by chopping and stirring the sample in a mixing bowl with a plastic trowel.

After homogenization was completed - Sample was split. A split was given to Tom. McCall (Bureau of Rec.)

Sample bags were labeled with the sample ID #, Samplers initials, and collection date.

Samples were sealed shut using fiberglass tape.

Chain of Custody forms were completed for all samples.

Photographs were taken of the site.

7-30-92 L. Elkin S. Schnoor (47)

Sample Descriptions (Cont)

HCX-12 Row 3
Bottom sandy clay orange in color
Top brown silty clay
Well sorted

Row 4 Same as 3

Row 5 Bottom sandy clay - orange as you go up back color becomes darker more Brown + less sand
Row 5 sandier than 1-4

HCX-11 20 subsites 4 sides per
Lt - moderate orange gravelly sand

Sample Descriptions (continued)

HCX-16 Southeast side of creek on bank. Subsite closest to channel silty sand, light brown, orange brown Subsite farther to SE up on bank dark brown silty clay

HCX-15. Northwest side of creek on bank. Most sites dark to med brown silty clay. Two subsite (easternmost and western most) closest to creek bottom silty sand.

HCX-14 Channel bottom Sandy gravels, light brown and light orange brown. Appear to be natural alluvium Several subsites were en well sorted sand (bars)

Samples HCX-11 thru HCX-16 were delivered to American West Analytical Lab in S.L.C. on 7-30-92 PM. by Steve Schnoor. Samples will be analyzed for Pb and As concentrations.

EXECUTIVE SUMMARY

The Bingham Channel, located down gradient from the Large Bingham Channel Reservoir, was historically used as a diversion channel for mine tailings disposal and meteoric runoff. The segment of Bingham Channel reclamation completed in 1992 involved the excavation and removal of tailings and related waste from the channel adjacent to Holy Cross Jordan Valley Hospital (Holy Cross) in West Jordan. Material removed from this site was placed in Blue Water One Repository on Kennecott property. Reclamation began July 1, 1992, and continued until completion July 29, 1992.

All work was conducted by employees, contractors, and subcontractors of Kennecott. Pre-construction and weekly safety meetings conducted by Kennecott and the removal contractor (Glen's), stressed the importance of proper engineering controls for the suppression of dust; health and safety issues pertaining to lead, arsenic, and other waste metals; construction hazards; and other topics that were essential to a safe and timely completion of project objectives.

A medical surveillance program was provided during the removal action. This medical surveillance provided a means to select employees who were physically able to safely perform the work assigned, and to monitor their health on a regular basis. Blood lead and urine arsenic levels were obtained from each employee before and after the work. An entrance medical examination was given to each employee before he/she began work. The examination complied with 29 CFR 1910.120(f). At the end of the job, all employees were given exit physicals, which consisted of blood lead and urine arsenic tests.

At the completion of the job, entrance and exit medical results were evaluated by the Kennecott Plant Projects Health and Safety Department. Urine arsenic levels in exposed individuals are typically found to be between 0-50 micrograms per gram (μg/g) of creatnine, but may range up to 100 μg/g in individuals who consume certain types of seafood. Total arsenic levels greater than 50 μg/l may be speciated to differentiate organic arsenic (seafood) from inorganic arsenic (industrial). No arsenic samples were speciated on this project. The highest level of total arsenic found in any employee at the end of the job was 39.3 μg/g. This is still within the normal range of arsenic-exposed individuals. Blood lead levels in exposed individuals are typically found to be between 0 and 30 μg/100g of blood. The highest level of blood lead level found on this project was 5 μg/100g of blood which is very low for exposed individuals. These test results indicate that lead and arsenic levels found in all employees on this removal action project were within the normal range.

In addition to the medical surveillance program, Kennecott adhered to the air monitoring plan during all aspects of the excavation and removal activities. The specific results of the air monitoring program can be found in the Final Air Monitoring

Report. Results collected during the Bingham Channel Work Action at Holy Cross show that airborne contaminant emissions produced were below regulated levels for total suspended particulates (TSP), arsenic, and lead.

Weekly safety meetings were conducted by Kennecott with the Removal contractor. The contractor also held a weekly safety meeting with their own employees. Daily pre-shift equipment safety inspections were conducted and documented. The use of water to dampen haul roads and other practices were used in preventing potential project employee exposures. The air monitoring contractor discussed the air monitoring results with the health and safety department for evaluation throughout the project and used to adjust removal activities and control measures, when necessary.

Detailed air monitoring results are enclosed in the Final Air Monitoring Report.

1.0 INTRODUCTION

The Bingham Channel at Holy Cross Health and Safety Plan applied to activities related to tailings and associated waste removal from Gingham Channel, haulage, and placement in Blue Water One Repository. The Health and Safety Plan was based on all available information pertaining to the site and on experience gained from similar programs conducted by Kennecott. The plan was designed to identify, evaluate, and control possible health and safety hazards associated with the project, such as pre-shift equipment safety inspections, task training, weekly toolbox safety meetings, etc.

The Excavation and removal work for the Bingham Channel Work Action at Holy Cross was initiated on July 1, 1992, and completed on July 29, 1992.

Kennecott initiated an air monitoring plan prior to and during all aspects of the removal activities. Engineering controls and work practices were evaluated and adjusted as necessary according to the results of the air monitoring. All air sampling methods, quality assurance and quality control procedures, laboratory methods and analysis, and air sampling results can be found in the final air monitoring report.. This report includes a site-specific Health and Safety Plan (HASP) assessment for this project.

Pre-construction and weekly safety meetings conducted by Kennecott with the removal contractor stressed the importance of proper implementation of engineering controls, health and safety issues pertaining to air quality, personal hygiene, and other topics that were essential to a safe and timely completion of project objectives. These health and safety requirements were enforced on a daily basis by the removal contractors health and safety officer. The removal contractor was required to make available a health and safety officer who reported directly to the Kennecott health and safety officer. The Kennecott health and safety officer also conducted periodic inspections on a regular basis.

2.0 SITE HEALTH AND SAFETY

This Final Health and Safety Report describes activities conducted during the Bingham Channel Work Action at Holy Cross. The Health and Safety Plan was designed to identify, evaluate, and control health and safety hazards associated with this project. The plan was based on existing information regarding the site, similar work conducted elsewhere, and past experience at other sites. Site-specific safety and health hazards and procedures necessary to protect the employees conducting the project were addressed.

The Health and Safety Plan (HASP) was covered during the "new-hire" employee orientation, and was made available at the work area and site trailers for review by employees, contractors, subcontractors and regulatory agencies. All visitors were familiarized with and complied with relevant aspects of the HASP.

2.1 Hazard Mitigation

The potential hazards associated with site activities included both physical and chemical hazards. Equipment operators and laborers directly involved in project activities had the greatest potential for exposure to physical and chemical hazards, while haul truck operators and supervisors had lower exposure potential, because of closed cabs of vehicles.

Excavation, loading and transport of concrete and soils with elevated metals could have generated airborne exposure to workers if engineering controls and monitoring had not been performed. As removal work occurred in the work area, dust-suppression was particularly important to the prevention of high concentrations of suspended particulates.

2.1.1 Physical Hazards

The physical hazards associated with site activities included heat stress, inclement weather, standard construction activity, and total dust emissions.

The above hazards were evaluated and controlled on a day-to-day basis. The physical hazards were discussed daily prior to work activities and during weekly safety meetings. Daily pre-shift equipment inspections were required and enforced. Hard hats, steel-toed boots, and safety glasses were required to guard against head, foot, and eye injuries. The physical hazards posed only minor problems and were successfully controlled during all phases of the project.

2.1.2 Chemical Hazards

Arsenic and lead were the only chemical hazards identified by the air monitoring conducted during work activities. Potential chemical hazards identified prior to the start of the removal action included lead and arsenic. The potential exposure routes to these hazards were through direct contact and/or inhalation or ingestion. The chemical hazards were mitigated by engineering controls, personal protective equipment (PPE), and personal hygiene procedures. Air sampling results indicated that employee exposure to total suspended particulates (TSP), arsenic and lead was below the PEL during all phases of the project.

2.2 Training Requirements

All employees and supervisors working in the excavation and placement of material were required to have 40 hours of Hazardous Substance Training per OSHA 29 CFR 1910.120. MSHA Newly Employed Experienced Miner Training was also required per 30 CFR 48.26. Training records were maintained on the job site by the Health and Safety Officer to ensure compliance. Prior to and during project activities, safety information discussed with employees included:

- Names of personnel and alternates responsible for site safety and health;
- Detailed review of the HASP;
- Detailed review of Kennecott Utah Copper (KUC) emergency protocol;
- Safe use of equipment on site;
- Chemical and physical hazards present on the site;
- Work practices by which risks from hazards can be minimized;
- Proper use of engineering controls;
- Use of personal protective equipment; and
- Site specific training, including recognition of symptoms and signs which might indicate overexposure to chemical hazards.

Site safety meetings were held at least weekly to notify personnel of specific hazards, air monitoring results, changes in the HASP, or other topics determined by the site Health and Safety Officer. Specific meetings were held at the initiation of new or different field activities and at the time of any crew or subcontractor crew changes.

2.3 Personal Protective Equipment

Occupational exposures to arsenic and lead for the entire project were below regulated levels specified by OSHA in 29 CFR 1910.1018 and 1910.1025, respectively. Occupational exposures to total suspended particulates for the project were below regulated levels specified in 29 CFR 1910.1000. Therefore, the level of personal protection utilized for all site activities were Level D (hard hats, steel-toed boots, and safety glasses).

2.4 Medical Surveillance Program

A medical surveillance program was provided for a means of selection of employees who were physically able to safely perform the work assigned and monitor their health on a regular basis. This medical surveillance program was developed to comply with 29 CFR 1910.120(f).

The program consisted of a pre-employment medical evaluation, an annual evaluation based on length of assignment, and a post-employment medical evaluation (exit medical) and had a provision for special evaluations in the event that an employee showed signs of overexposure to lead or arsenic. No special evaluations were required on this project.

A medical surveillance was conducted for all site personnel who worked in the exclusion zone for more that 30 days. All personnel who participated in the medical surveillance program received the following pre-employment examination.

- Medical and Occupational History;
- Physical Examination;
- Pulmonary Function Test;
- Six Frequency Audiogram;
- Urinalysis, with microscopic morphology and dipstick;
- Complete Blood Count;
- CHEM 20 Chemistry Screen;
- SAM 9 Drug Screen;
- Chest X-Ray read by "B" reader; and
- Blood lead and urine arsenic levels (urine arsenic were speciated if higher than 50 μg/g of creatnine)

Exit medical examinations consisted of the following:

- Blood lead and urine arsenic levels (urine arsenic were speciated if higher than 50 μg/g of creatnine)

Copies of all pre-employment and exit medicals can be found in the medical files maintained by the health and safety officer.

3.0 EVALUATION

A Site-Specific Health and Safety Plan (HASP) and an Air Monitoring Plan were implemented to minimize worker exposure to physical and chemical hazards. The plans were enforced to protect personnel working on the Bingham Channel Work Action at Holy Cross to minimize the generation of particulate emissions.

3.1 Site Health and Safety Results

The contractor that worked on the Bingham Channel Work Action at Holy Cross concluded with a total of 20,553 man hours with no recordable injuries, as compared to 12.4 for the national average. Key elements in the safe completion of the project included:

- Pre-construction and weekly safety meetings conducted by Kennecott with the relocation contractor stressing the importance of all aspects of site-specific safety.
- Daily pre-shift equipment safety inspections.
- Employee awareness of health and safety issues pertaining to particulate generation and its potential to contain metals such as arsenic and lead. This included implementation of engineering controls, employee personal hygiene, and the proper use of personal protective equipment.

Exit medicals show that both blood lead and urine arsenic levels found in employees on this project were well within the normal range.

3.2 Air Sampling Results

Quantitative and qualitative air monitoring data gathered on the project provided ample information concerning the airborne contaminant generation from the removal activities. Air sampling results may be examined in detail in the Final Air Monitoring Report. From the air monitoring results, the following evaluation can be made:

- The results documented that no employees were exposed to airborne concentrations of arsenic, lead, or TSP at or approaching regulated levels (PEL).

- The personal protective equipment used by the Bingham Channel at Holy Cross employees (level D) was sufficient to protect them against airborne contaminants.

- The engineering controls used were effective in suppressing work zone airborne contaminant emissions.

EXECUTIVE SUMMARY

The Bingham Channel, located down gradient from the Large Bingham Channel Reservoir, was historically used as a diversion channel for mine tailings disposal and meteoric runoff. The segment of Bingham Channel reclamation completed in 1992 involved the excavation and removal of tailings and related waste from the channel adjacent to Holy Cross Jordan Valley Hospital (Holy Cross) in West Jordan. Material removed from this site was placed in Blue Water One Repository on Kennecott property. Reclamation began July 1, 1992, and continued until completion July 29, 1992.

All work was conducted by employees, contractors, and subcontractors of Kennecott Utah Copper. Pre-construction and weekly safety meetings conducted by Kennecott with the removal contractor (Glen's Excavating) stressed the importance of proper engineering controls implementation for the suppression of dust, and health and safety issues pertaining to lead, arsenic, and other waste metals.

Kennecott initiated an air monitoring plan during all aspects of the excavation and removal activities. The Air Monitoring Plan, included in the Work Plan that was approved by letter from the EPA, was based on all available information pertaining to the site and experience gained from similar programs conducted by Kennecott. This plan was implemented during the removal action to assess the potential generation of total suspended particulates (TSP) containing indicator metals (lead and arsenic), to evaluate the engineering controls and work practices used to suppress airborne contaminants, and to document any possible employee exposure to these contaminants.

The air sampling program was carried out by Envirocon, Inc. Background air samples were collected prior to excavation and removal activities to establish TSP and indicator metals baseline ambient air concentrations. Once work began, the daily air monitoring involved personal and work zone air sampling. The air samples were collected using both battery powered personal air sampling pumps and high volume (work zone) sampling pumps. Placement of these pumps around the work area and on removal workers insured that all aspects of the removal action were monitored. All air samples were analyzed for TSP, lead, and arsenic.

Air monitoring results obtained during the Bingham Channel Work Action at Holy Cross show that airborne contaminant emissions produced were below regulated levels for total suspended particulates, arsenic, and lead. Water to dampen haul roads and the excavation, a truck decontamination station, careful loading of excavated material, enclosed cabs on machinery and haul trucks, good employee personal hygiene, and employee awareness were all essential and adequate in preventing potential project employee exposures and off site migration of contaminants. Air monitoring results were evaluated throughout the project and used to adjust removal activities when necessary.

1.0 INTRODUCTION

The Bingham Channel at Holy Cross Air Monitoring Plan applied to activities related to the tailings and associated waste removal from Bingham Channel, haulage, and placement in Blue Water One Repository. The air monitoring plan was based on all available information pertaining to the site and on experience gained from similar programs conducted by Kennecott. The plan was designed to identify, evaluate, and control possible health and safety hazards associated with the generation of total suspended particulates having the potential to contain indicator metals (lead and arsenic).

Excavation and removal work for the Bingham Channel Work Action at Holy Cross was initiated on July 1, 1992, and completed on July 29, 1992. Kennecott initiated the air monitoring plan prior to and during all aspects of the removal activities. Engineering controls and work practices were evaluated and adjusted as necessary according to the results of the air monitoring. All air sampling methods, quality assurance and quality control procedures, laboratory methods and analysis, and air sampling results are discussed in detail in the respective sections of the report.

2.0 SITE AIR SAMPLING

The Bingham Channel at Holy Cross Air Monitoring Plan was initiated on June 24, 1992 with the collection of background samples. These samples were analyzed for total suspended particualtes (TSP), arsenic, and lead. The results were used to determine the initial personal protective equipment (PPE) to be used. Personnel and work zone air monitoring was initiated with the start up of removal activities on July 1, 1992. All phases of the tailings removal were monitored until work was finished on July 29, 1992. Air monitoring was conducted on every haul day for the duration of the project unless inclement conditions existed which would affect sampling results. The objectives of the air monitoring were as follows:

1) To establish the level of PPE needed for employees involved in daily activities at the work site.

2) To document any employee exposure to airborne contaminants generated by the tailings removal activities, and

3) To evaluate the effectiveness of engineering controls being used to suppress work zone airborne emissions.

The daily sample sweep consisted of three to six personnel and work zone air samples along with one quality control (QC) blank which was placed near a running sampler. Work zones and personnel that were monitored included the tailings removal personnel and work zone, decontamination (decon) personnel and work zone, truck drivers, haul roads, and repository. The haul roads and repository were monitored under the Relocated Utah Copper (Mixed) Tailings Work Action Air Monitoring Program. Refer to Holy Cross Jordan Valley Hospital Air Monitoring Locations (Figure 1) and map of repository and haul road (drawing no. 451-T-2432) in Appendix A for specific air sampling site locations.

The air sampling was conducted according to the Occupational Safety and Health Administration (OSHA) Standards (29CFR, Part 1910). These include Subpart Z, Sections 1910.1000 (particulates and PM10), 1910.1018 (inorganic arsenic), and 1910.1025 (lead). All samples were handled under chain-of-custody procedures and delivered to a qualified laboratory where they were analyzed according to the appropriate National Institute of Occupational Safety and Health (NIOSH) and OSHA methods (see Section 4.1). The results are quantitative and were used to document work zone air quality and worker exposure. Spontaneous, real-time data was also collected. Quantitative (personnel) sampling, and qualitative (real-time) sampling methods are described in sections 2.1 and 2.2 respectively.

2.1 Quantitative Air Sampling

Personnel air samples were collected using battery powered Gilian personal pumps (carried by the worker) that drew 2.0 liters per minute of air through a filter. These samples provided a good estimation of the air quality of an individual's immediate work area. Two to three samples were collected daily, with closer attention given to personnel working in areas of potentially high exposure to lead, arsenic, and particulates (such as the excavator and dozer operators). Decon work zone samples were also collected using personal pumps. Daily personal air samples were analyzed for TSP, arsenic, and lead.

Excavation work zone samples were collected using Gilian Aircon-2 high volume ("hi-vol") pumps that drew 20.0 liters per minute of air through a filter. The excavation work zones sampled were the tailings removal areas. Two to three hi-vols were placed around the perimeter of the work area and were used to estimate work-zone emissions. Placement of the pumps was adjusted according to work activities and wind direction.

Locations along the haul road and at the repository were sampled with personal pumps, and the results are included in the Relocated Utah Copper (Mixed) Tailings Removal Action Final Air Monitoring Report. Haul road and repository air samples were analyzed for TSP, arsenic, and lead.

2.2 Qualitative Air Sampling

Real-time air monitoring instruments provide instantaneous results which can be used to modify the engineering controls, work practices and/or PPE. This data was collected for the removal action using a "miniature real-time aerosol monitor" (Miniram). The Miniram is a nephelometer which measures the light-scattering effect of particulates and gives an estimated, digital representation of the respirable dust concentration (PM10) of an area. This instrument was placed in the field with a personal pump (as a reference), and in locations determined to have the greatest potential for air emissions. The use of this instrument allowed project supervisors to immediately adjust work activities.

3.0 QUALITY ASSURANCE AND QUALITY CONTROL

The purpose of the Quality Assurance/Quality Control (QA/QC) Program was to assure that data generated during the air monitoring program was accurate and consistent with QA/QC objectives. The quality of the data was assessed based on accuracy and completeness. Accuracy is a determination of how close the measurement is to the true value and was assessed by the cleanliness of field blanks. Using this criterion, 100 percent accuracy was obtained. Completeness is a measure of the amount of valid data obtained, compared to the amount that was expected under normal conditions. Ninety-eight percent (98.0%) completeness was attained during the Bingham Channel at Holy Cross Air Monitoring Program (see Appendix C). The project data objectives for accuracy and completeness are consistent with guidelines established by NIOSH and OSHA.

QA/QC procedures for air sampling required the calibration of instruments, the completion of a sampling log, following chain-of-custody procedures, and the use of quality control blanks. Additionally, internal QA/QC audits and laboratory audits were conducted. The following sections describe each of these QA/QC procedures.

3.1 Instrument Calibration

Personal sampling pumps were calibrated following NIOSH protocol. The pumps were calibrated at the beginning and end of each sampling day with a BIOS International DryCal calibrator and the data recorded in the pump calibration logbook. The filter cassette used for pre-calibration was also used for post-calibration. If the start/stop flow rates differed by more than 20%, the sample for that day was voided. For this project, the maximum start/stop flow

rate percent difference for non-voided samples was less than 2.5%. It should be noted that the BIOS International DryCal calibrator is an approved EPA primary standard.

3.2 Field Sampling Logbook

Field logbooks were kept to record information on every aspect of the samples taken. The following entries were made in the field logbook for each sampling day:

- Date;
- Sampling personnel;
- Weather conditions;
- Air pump number;
- Pump start and stop times, elapsed time;
- Sampling location for area monitors (including location of field blank);
- Personnel and location if personal pump;
- Sampling method (i.e., personal or real-time);
- Field observations; and
- Signature of sampler.

Maps were added as necessary. Significant deviations from sampling protocol were formally noted in the field log, as well as unusual circumstances which may have affected the sampling. Additional information was included in the chain-of-custody logbook each day.

3.3 Sampling Chain-of-Custody

The purpose of "chain-of-custody" was to insure that the sample or data retained its integrity and was not contaminated, lost, or damaged. Chain-of-custody tracked who was responsible for a particular sample or data at each point as it moved from the field through the laboratory or data processing. Documentation of chain-of-custody for air sampling included the sampling logbook, the chain-of-custody record (request for analysis form), and the personal sample data sheet.

3.4 Quality Control Samples

One quality control (QC) field blank was submitted with each sample shipment. A QC blank is an opened but unsampled filter cassette. The cartridges were placed near an active sampler each day and returned to the lab with the other samples as a test for contamination during sampling and transport. The presence of contamination in field blanks would indicate that field and/or laboratory procedures were not adequate to prevent contamination of samples.

Of the total samples taken for the project, 19.6 percent were field blanks. As mentioned earlier, field blanks are used to test sampling accuracy. Analytical results obtained for the field blanks showed no contamination, indicating that the field, shipping, and laboratory procedures were adequate for this project. For this project, 100 percent accuracy was obtained.

3.5 Quality Control Audits

Quality control system audits were conducted once a month by the QA/QC coordinator as an internal check on all components of the monitoring procedures including field and laboratory methods. The purpose of the QA/QC audit was to:

1. Identify and correct reporting errors.
2. Ensure that quality data is being reported.
3. Determine if a sufficient amount of air sampling is being performed in accordance with Federal regulations.

All audits performed revealed overall system integrity and conformance with the sampling plan. Copies of the QA/QC audits are included in Appendix C.

3.6 Data Reduction, Validation, and Reporting

All data is reported in appropriate units, and raw data has been reviewed and validated against calibration and chain-of-custody records to ensure that all the reported data is reliable and is in compliance with QA/QC objectives. Upon completion, a copy of the signed QA/QC report, showing accumulated precision and accuracy data, was maintained for future reference (Appendix C).

3.7 Quality Assurance Reports to Management

Weekly meetings were held for the duration of the project between the Project Manager and the Project Engineer to discuss conformance of the project effort with the QA/QC Plan. Any major issues requiring attention were immediately addressed and corrected.

4.0 LABORATORY METHODS AND ANALYSIS

Biotrace Laboratories of Salt Lake City, Utah was responsible for the analysis of all samples collected. The following sections describe the laboratory methods and findings.

4.1 Laboratory Methods

Biotrace Laboratories conducted the analyses of all air filter cassettes collected during the removal action. Turnaround time for the sample results was approximately ten days to two weeks unless otherwise specified. The analysis consisted of a gravimetric method for determination of total suspended particulates with a detection limit of 100 micrograms per cubic meter ($\mu g/m^3$) for personal samples. Arsenic analysis was conducted using a Zeeman Furnace Atomic Absorption Spectrophotometer with a detection limit of 1.0 $\mu g/m^3$. Lead analysis was conducted by flame atomic absorption spectrophotometry with a detection limit of 2.0 $\mu g/m^3$.

4.2 Laboratory Findings

For the entire project, 102 samples were collected and analyzed using the aforementioned criteria. Air sampling results summarized in Appendix B, Table 1 (Holy Cross) were below the permissible exposure limit (PEL) for total suspended particulates (TSP), the respirable fraction of the total particulates (PM10), arsenic (As), and lead (Pb).

The haul roads and repository were monitored under the Relocated Utah Copper (Mixed) Tailings Work Action Air Monitoring Program. All samples collected during placement of Holy Cross tailings at Bluewater One Repository were within standards for TSP, PM10, arsenic, and lead.

The results of all air monitoring were shown to all the removal action contractor employees within five days of receiving them as per OSHA regulations. These results are summarized in Appendix B.

5.0 EVALUATION

Recommendations were made prior to the project to protect personnel working on the Bingham Channel Work Action at Holy Cross from hazards. As a result of these recommendations a site-specific air monitoring program was implemented to minimize worker exposure to airborne physical and chemical hazards. Results from air monitoring were used to adjust site activities to reduce particulate generation.

5.1 Air Sampling

Quantitative and qualitative air monitoring data gathered on the project provided ample information concerning the airborne contaminant generation from the removal action activities. From the air monitoring results, the following evaluation can be made:

- The results documented that no employees were exposed to airborne concentrations of TSP, arsenic, lead, or PM10 at or approaching regulated levels (PEL).
- The results documented that there was little off site migration of particulate matter and no off site migration of arsenic or lead for the duration of the job.
- The personal protective equipment used by the removal employees (level D) was sufficient to protect them against airborne contaminants.
- The engineering controls used were effective in suppressing work zone airborne contaminant emissions.

APPENDIX C:
QA/QC REPO

QUALITY ASSURANCE/QUALITY CONTROL AUDIT

PROJECT: **Bingham Channel at Holy Cross Removal Action**
MONTH: **June, 1992**

The Quality Assurance/Quality Control audit is performed once a month as an internal check on all personnel/work zone air monitoring for each project. The purpose of the QA/QC audit is to:

1) Identify and correct reporting errors;
2) Ensure that quality data is being reported; and
3) Determine if a sufficient amount of air sampling is being performed in accordance to Federal Regulations.

The following QA/QC parameters were examined for June, 1992:

A. Number of samples collected:	9
B. Number of samples voided/lost:	0
C. Number of blanks for month:	3
D. Percent of blanks: D(%) = [C/A]100	33.3
E. Percent completion: E(%) = [100 - (B/A)100]	100.0
F. Number of sampling days lost to rain/holidays:	1

Note: Enter A,B, & C; then hit Layout/Tables/Calculate.

Total QA/QC parameters for project to date:

G. Total number of samples collected for project:	9
H. Total number of samples voided/lost for project:	0
I. Total number of blanks for project:	3
J. Percent of blanks: J(%) = [I/G]100	33.3
K. Percent completion: K(%) = [100 - (H/G)100]	100.0
L. Number of sampling days lost to date:	1

Note: Enter G,H, & I; then hit Layout/Tables/Calculate.

COMMENTS:

Three days background sampling during month of June (6/24, 6/25, 6/26/93).
Rain on June 30 - no sampling.

QUALITY ASSURANCE/QUALITY CONTROL AUDIT

PROJECT: **Bingham Channel at Holy Cross Removal Action**
MONTH: **July, 1992**

The Quality Assurance/Quality Control audit is performed once a month as an internal check on all personnel/work zone air monitoring for each project. The purpose of the QA/QC audit is to:

1) Identify and correct reporting errors;
2) Ensure that quality data is being reported; and
3) Determine if a sufficient amount of air sampling is being performed in accordance to Federal Regulations.

The following QA/QC parameters were examined for July, 1992:

A. Number of samples collected:	93
B. Number of samples voided/lost:	2
C. Number of blanks for month:	17
D. Percent of blanks: D(%) = [C/A]100	18.3
E. Percent completion: E(%) = [100 - (B/A)100]	97.9
F. Number of sampling days lost to rain/holidays:	4

Note: Enter A,B, & C; then hit Layout/Tables/Calculate.

Total QA/QC parameters for project to date:

G. Total number of samples collected for project:	102
H. Total number of samples voided/lost for project:	2
I. Total number of blanks for project:	20
J. Percent of blanks: J(%) = [I/G]100	19.6
K. Percent completion: K(%) = [100 - (H/G)100]	98.0
L. Number of sampling days lost to date:	5

Note: Enter G,H, & I; then hit Layout/Tables/Calculate.

COMMENTS:

Two days sampling lost to rain, two days lost to holidays for month of July. Removal of tailings at Holy Cross completed on 7/29/93. Crew begin work at Tailwater Ditches on 7/30/93.

Final Phase II Environmental Site Assessment Report

Bangerter Highway W 9000 S Interchange

Prepared for Utah Department of Transportation

West Jordan, Utah

August 2016

(page is intentionally blank to allow for double sided printing)

August 22, 2016

Mr. Marwan Farah, P.E.
Project Director
Utah Department of Transportation
4501 2700 W
Salt Lake City, UT 84119

Re: Bangerter Highway and W 9000 S
Phase II Environmental Site Assessment Results
HDR Project No. 10029760

Dear Marwan:

We are pleased to provide you with the above-referenced *Phase II Environmental Site Assessment* (ESA) Report, presenting soil monitoring activities and analytical results at the project site.

HDR appreciates the opportunity to serve the Utah Department of Transportation on this important project. If you have any questions or comments, please feel free to contact me at (208) 387-7033.

Cordially,

HDR, Inc.

Michael Murray, Ph.D.
Project Manager

1 Introduction

The Utah Department of Transportation (UDOT) proposes a project that includes replacing an existing 720-foot-long, 84-inch-diameter corrugated pipe, that extends from the west side of Bangerter Highway, just south of Winthrope Circle in the Vista West Subdivision, to the Jordan Valley Hospital property east of Bangerter Highway and north of W 9000 S (**Figure 1** and **Figure 2**).

In July 2016 at UDOT's request, HDR, Inc. (HDR) conducted a Phase I Environmental Site Assessment (ESA) of properties at the Bangerter Highway and W 9000S Street intersection (Subject Property). The Subject Property includes several landowners (HDR 2016a).

HDR conducted this ESA in conformance with the scope and limitations of the American Society for Testing and Materials (ASTM) Practice E 1527-13; the ESA satisfies the requirements of Title 40 of the Code of Federal Regulations (CFR) Part 312 (40 CFR 312).

As reported in the Phase 1 ESA, the Subject Property includes a portion of Bingham Creek, which was part of response actions implemented at the Kennecott South Zone Superfund Site near Copperton, Utah. Response actions in the 1990s, within and adjacent to the Subject Property, included three phases of soil removal activities from the Bingham Creek channel and its banks along residential areas to address lead and arsenic contaminated soils. Contaminated sediments were also removed from Bingham Creek in 1992 during construction of the Jordan Valley Hospital.

HDR included the following recommendation in the Phase I ESA:

- **Recommendation 1**: Conduct a Phase II site investigation to determine concentrations of lead and arsenic in the soil along Bingham Creek, which was part of response actions implemented at the Kennecott South Zone Superfund Site near Copperton, Utah.

A Phase II site investigation was necessary to assess the concentrations of constituents of concern (COCs)—arsenic and lead—in the soil along Bingham Creek and adjacent areas that could be disturbed during the Bangerter Highway W 9000 S Interchange Project. The City of West Jordan also requested that UDOT collect samples for toxic characteristic leaching procedure (TCLP) analysis. This report presents data objectives and needs, the field activities, and the results of this Phase II ESA.

2 Site Description

2.1 Location and Legal Description

The Subject Property is comprised of UDOT-owned, right-of-way property along the Bangerter Highway and W 9000 S intersection and multiple adjoining parcels (private property and City owned property) in West Jordan, Utah, 84088. The various portions of the Subject Property are located in Section 5 of Township 03 South, Range 01 West in Salt Lake County (**Figure 2**).

2.2 Site and Vicinity Characteristics

The Subject Property is comprised of single-family residential lots and one residual lot, owned by the City of West Jordan, which consists of Bingham Creek and its banks. The Subject Property also includes UDOT right-of-way along the east and west side of Bangerter Highway and the north and south side of W 9000 S Street. Primary access to the Subject Property is by Bangerter Highway or W 9000 S Street. Access to the residential lots (Vista West subdivision) in the southwest corner of the intersection of Bangerter and W 9000 S is by heading south from W 9000 S on Winthrope Drive. The Subject Property is located within a mixed residential and commercial area, which includes the Jordan Valley Hospital northeast of the intersection, the Salt Lake Community College campus in the southeast corner of the intersection, and a currently fallow pasture on the northwest corner of the intersection.

2.3 Description of Structures, Roads, and Other Site Improvements

The Subject Property is developed except the fallow pasture located on the northwest corner of the intersection of Bangerter Highway and W 9000 S Street. Development includes residential subdivisions, athletic fields, and parking lots associated with the Salt Lake Community College Jordan Campus, and medical facilities and parking lots associated with the Jordan Valley Medical Center.

2.4 Area Geology, Hydrogeology, and Soil Characteristics

West Jordan, Utah, is located between the Jordan River and the Oquirrh Mountains within the Jordan River Basin. The Subject Property is located within the historic floodplain of Bingham Creek, which consists of Post-Lake Bonneville (Holocene) alluvial deposits ranging from silty, fine- to coarse-grained sand, and pebbles and cobbles. The area to the north and south of the historic floodplain along Bingham Creek consists of Bonneville Lake Cycle (late Pleistocene) fine-grained lacustrine deposits. The area to the west consists of late Pleistocene gravel of lacustrian and/or alluvial origin.

Depth to groundwater varies near the Subject Property; however, in general, it is at least 80 feet below land surface. The groundwater gradient is toward Jordan River to the east (Stolp 2007).

Table 2-1 characterizes the dominant soils in the area, based on a Natural Resource Conservation Service (NRCS) soil survey for Salt Lake County (2016).

Table 2-1. Dominant Soils Mapped by NRCS for Subject Property

Soil Component Name (surface texture)	Red Rock Silt Loam
Characteristics	The Red Rock Silt Loam occurs along the historic floodplain of Bingham Creek, with a typical profile of silt loam from 0-4 inches, silty clay loam from 4-28 inches, clay loam from 28-40 inches, silt loam from 40 to 45 inches, and silty clay loam from 45 to 60 inches. The parent material is alluvium.
Soil drainage class	Well drained. Moderately low to moderately high transmissivity (0.06 to 0.20 inches per hour). The available water storage is high.
Depth to bedrock	More than 80 inches
Soil Component Name (surface texture)	Bingham Gravelly Loam
Characteristics	The Bingham Gravelly Loam occurs to the south of the historic floodplain of Bingham Creek, with a typical profile of gravelly loam from 0-6 inches, gravelly sandy clay loam from 6-12 inches, gravelly fine sand loam from 12-18 inches, very gravelly sand loam from 18 to 27 inches, and extremely gravelly sand from 27 to 60 inches. The parent material is fine-loamy slope alluvium derived from quartzite and/or limestone over sandy and gravelly lacustrine deposits derived from quartzite and/or limestone.
Soil drainage class	Well drained. Moderately high to high transmissivity (0.60 to 2.00 inches per hour). The available water storage is very low.
Depth to bedrock	More than 80 inches
Soil Component Name (surface texture)	Butterfield Soils
Characteristics	The Butterfield soils occur to the north of the historic floodplain of Bingham Creek, with a typical profile of gravelly silt loam from 0-5 inches, very gravelly silt loam from 5-10 inches, extremely gravelly loam from 10-22 inches, very gravelly loam from 22 to 50 inches, and unweathered bedrock from 50 to 60 inches. The parent material is colluvium and/or residuum.
Soil drainage class	Well drained. Very low to moderately high transmissivity (0.00 to 0.20 inches per hour). The available water storage is very low.
Depth to bedrock	50 inches

3 Previous Soil Investigations

The Subject Property includes a portion of Bingham Creek, which was part of response actions implemented at the Kennecott South Zone Superfund Site near Copperton, Utah. The Subject Property is part of Operable Unit 1 (OU1), which consists of Bingham Creek downstream of the Kennecott South Zone Superfund Site. Response actions in the 1990s, within and adjacent to the Subject Property, included three phases of soil removal activities from the Bingham Creek channel and its banks along residential areas to address lead and arsenic contaminated soils. Contaminated sediments were also removed from Bingham Creek in 1992 during construction of the Jordan Valley Hospital. Bingham Creek flows through a 84-inch diameter, 720-foot-long, corrugated metal pipe from the Vista West Subdivision towards the Jordan Valley Hospital (northeasterly direction).

The executive summary of the *Second Five Year Review Report* for the Kennecott South Zone (EPA 2010) states the following:

> *"Although the residential area response actions at OU1 were conducted in accordance with the Action Memoranda (and therefore may be functioning as intended), it is not clear from the site files whether all residential properties ultimately were cleaned to the final lead standard of 1,100 mg/Kg. This is due to an inconsistency in the lead action level required in the Action Memoranda for the Phase I residential removal action (2,500 mg/Kg) and the Phase II and III residential removal actions (1,100 mg/Kg). The OU1 ROD identifies the appropriate action level for lead in a residential setting as 1,100 mg/Kg. Therefore, if the Phase I residential cleanup achieved a lead standard of 2,500 mg/Kg, this portion of the remedy would not be functioning as intended by the ROD."*

The December 29, 2015, Utah Department of Environmental Quality's (UDEQ) technical memorandum, "Compilation of soil and groundwater action levels," for Kennecott north and s zones is attached in Appendix A. See the Phase 1 ESA (HDR 2016a) for more details on the Kennecott site.

(page is intentionally blank to allow for double sided printing)

4 Soil Investigation Activities

This section presents data objectives and needs, and describes HDR's field activities conducted August 3 and 4, 2016, for this Phase II ESA.

4.1 Data Objectives and Needs

As addressed in the *Second Five Year Review Report,* the status of response actions at OU1 are in post-construction operation and maintenance with wastes remaining in place. Future development could affect potentially contaminated soils along Bingham Creek. UDEQ and the U.S. Environmental Protection Agency (EPA), Region 8, have compiled soil action levels for Bingham Creek, necessitating soil sampling to assess COC concentrations for arsenic and lead in the soil along Bingham Creek.

The soil action levels for OU1 are compiled in UDEQ's December 29, 2015 technical memorandum (Appendix A). The listed residential action levels for lead are 1,100 milligrams per kilogram (mg/kg) and 100 mg/kg for arsenic.

4.2 On-Site Soil Investigation

HDR conducted on-site activities in accordance with the document, *Phase II Environmental Site Assessment Work Plan* (HDR 2016b).

4.2.1 Discrete Soil Samples

The proposed project includes replacing an existing 720-foot-long, 84-inch-diameter corrugated pipe, that extends from the west side of Bangerter Highway, just south of Winthrope Circle in the Vista West Subdivision, to the hospital property east of Bangerter Highway and north of W 9000 S. The existing culvert would be replaced with a box culvert or similar hydraulic structure (to be determined). During construction of the new culvert, soil would likely be excavated within Bingham Creek. For planning purposes, a total depth of excavation at the bottom of Bingham Creek is assumed to be approximately 3.5 feet.

With a goal to determine lead and arsenic concentrations in areas of disturbance within Bingham Creek and the areas adjacent to Bingham Creek, HDR advanced soil borings using a hand auger and collected soil samples at the following locations (see **Figure 3** and **Table 4-1**):

- 10 borings within Bingham Creek (5 upstream of Bangerter Highway and 5 downstream),
- 4 borings adjacent to Bingham Creek (2 upstream of Bangerter Highway and 2 downstream), and
- 2 borings near the Bangerter Highway W 9000 S intersection (1 northwest quadrant and 1 southeast quadrant)

At each boring location, HDR collected one sample at 0 to 12 inches and one sample at 24 to 36 inches.

Table 4-1. Number of Soil Samples that were collected from each Boring

Boring Location	Number of Borings	Number of Soil Samples	Sample per Boring
Bed and Bank of Bingham Creek	10	20	Sample 1: 0-12 inches from surface Sample 2: 24-36 inches from surface
Areas adjacent to Bingham Creek	4	8	Sample 1: 0-12 inches from surface Sample 2: 24-36 inches from surface
Northwest quadrant	1	2	Sample 1: 0-12 inches from surface Sample 2: 24-36 inches from surface
Southeast quadrant	1	2	Sample 1: 0-12 inches from surface Sample 2: 24-36 inches from surface
Total	16	32	Note: 30 discrete samples were collected for laboratory analysis, as 2 samples could not be collected due to auger refusal or collapsing boring)

HDR's sampling team determined the exact sampling locations in the field following a review of accessibility, utility locations, and consideration of personnel safety.

For each boring, the sampling team collected a discrete soil sample at the specified depth, placed the soil sample into a clean (decontaminated) mixing bowl, mixed lightly, and then placed a subset of the sample into a laboratory sample jar for laboratory analysis. In addition, they placed a subset of each sample into a clean bucket to serve as part of a composite sample as described in Section 4.2.2. This approach of collecting discrete soil samples at a specified depth allows for assessing concentrations of lead and arsenic with depth and specific locations. The sampling team collected 30 soil samples out of a goal of 32 samples. They could not collect 2 samples; in one case, the boring collapsed due to water flowing over the boring, and in the other case, the boring could not be advanced past a depth of 1 foot (auger refusal).

Upon collection, the sampling team labeled each sample container and placed it in a clean ice chest, where the samples chilled until delivery to the laboratory. The sampling team followed standard chain-of-custody procedures from the time they collected samples until the samples arrived at the laboratory. After sampling, the sampling team backfilled each opening with soil cuttings.

4.2.2 Composite Soil Samples for TCLP analysis

The sampling team collected four composite samples for TCLP analysis, by taking a small sample volume from each of the discrete samples at the appropriate depth and combining them in a mixing bowl.

Two composite samples are from the southwest quadrant (Vista West subdivision); one of these composite samples consisted of soil collected from each discrete sample at a depth from 0 to 1 feet; and the second composite sample consisted of soils collected from each discrete sample from 2 to 3 feet.

- SW-TCLP-0-1= composite of all samples (Bingham Creek and floodplain) taken from 0-1 feet in the south west quadrant.
- SW-TCLP-2-3= composite of all samples (Bingham Creek and floodplain) taken from second depth increment (variable depths) in the south west quadrant

Similarly, two composite samples are from the northeast quadrant (Jordan Valley Hospital), and collected from the same depth increments as the southwest quadrant samples.

- NE-TCLP-0-1= composite of all samples (Bingham Creek and floodplain) taken from 0-1 feet in the north east quadrant.
- NE-TCLP-2-3= composite of all samples (Bingham Creek and floodplain) taken from second depth increment (variable depths) in the north east quadrant.

4.2.3 Equipment Decontamination

The sampling team decontaminated sampling equipment (hand auger, mixing bowl, mixing spoon) prior to collecting the next sample, using the following procedure:

- Wash and scrub equipment with phosphate-free, laboratory-grade detergent (e.g., Alconox™ or equivalent)
- Rinse with distilled water
- Air dry

The sampling team also used disposable nitrile gloves for each sample collected.

4.2.4 Quality Assurance and Quality Control

To assess the effectiveness of equipment decontamination, the sampling team collected a "decon" blank sample. They poured distilled water over the decontaminated hand auger and mixing bowl, collected the water and placed an aliquot of the water into a laboratory supplied sample jar, and had the water sample analyzed for lead and arsenic.

4.2.5 Laboratory Analyses

HDR shipped overnight a chilled and secured cooler with soil samples and the decon blank sample to ESC Lab Sciences (ESC) in Mt. Juliet, Tennessee. ESC laboratory analyses and methods are summarized in **Table 4-2**.

Table 4-2. Proposed Laboratory Analyses

Analytical Parameter	Method
Lead	EPA Method 6010b
Arsenic	EPA Method 6010b
TCLP RCRA Metals[1]	EPA Method 6010/7470

[1]RCRA Metals: arsenic, barium, cadmium, chromium, lead, mercury, selenium, and sliver.

4.3 Health and Safety

The sampling team conducted all activities under the supervision of senior HDR project personnel and in strict accordance with a health and safety plan, which was completed prior to beginning field activities.

(page is intentionally blank to allow for double sided printing)

5 Results and Conclusions

5.1 Arsenic and Lead

Table 5-1 summarizes the analytical results (laboratory reports are presented in Appendix B). The listed UDEQ residential action levels for lead are 1,100 mg/kg and 100 mg/kg for arsenic. Discrete soil samples ranged from 48.9 to 351 mg/Kg for lead and 7.43 to 49.4 mg/Kg for arsenic. Values are below the residential action levels identified in the UDEQ technical memorandum (Appendix A).

5.2 TCLP

All four TCLP samples (NE-TCLP-0-1, NE-TCLP-2-3, SW-TCLP-0-1, and SW-TCLP-2-3) were non-detect for mercury, arsenic, barium, cadmium, chromium, lead, selenium, and silver. Laboratory reports are presented in Appendix B.

5.3 Equipment Rinsate

The equipment rinsate (ER-1) was non-detect for lead and arsenic.

5.4 Conclusions

Soil sample results are below the action levels established by UDEQ (Appendix A) for soil lead and arsenic under a residential scenario. This suggest that no remedial action would be required by UDEQ for these soils. Furthermore, soils are below the TCLP threshold values, indicating that the excavation of soils would not result in the generation of hazardous waste.

Table 5-1. Analytical Results for Lead and Arsenic

Sample ID	Total Solids %	Arsenic (mg/kg, dry)	Lead (mg/kg, dry)	Sample Depth (feet)	Comments
NE-BC-1-0-1	87.0	17.4	196	0-1	Upper south bank.

TECHNICAL MEMORANDUM

SUBJECT: Compilation of soil and groundwater action levels

FROM: Douglas Bacon, UT DEQ–DERR DCB

Kerri Fiedler, U.S. EPA Region 8 KF

TO: Kennecott North and South Zones Administrative File

DATE: December 29, 2015

Since 1998, four records of decision (RODs) have been issued for the Kennecott North and South Zone operable units (OUs). Under each of these RODs various land use action levels for metals in soils were selected. Similarly, various action levels for groundwater contaminants were established under the RODs or by the State of Utah's Groundwater Protection Program (GWPP). This technical memorandum compiles all the action levels into a single document and clarifies inconsistencies determined during recent five-year reviews.

The UT DEQ-DERR and the EPA Region 8 (Agencies) have compiled the soil action levels for OUs 1, 3-15, 17-20, 22, and 24 (Attachment 1). Listed action levels are obtained from existing risk assessment and risk management documents which are part of the administrative record. There are footnotes at the end of the soil action levels table which explain the applicability of the action levels and define the action which can be performed to address an exceedance. Numbered notes on the table provide reference where each of the listed action levels are obtained.

The Agencies have compiled the groundwater action levels for OUs 2, 12, 16, and 23 (Attachment 2). Listed action levels are obtained from existing human health and ecological risk assessment and risk management documents which are part of the administrative record. The listed action levels also take into account the Agencies' selected remedy to rely on the permitting restrictions of the State of Utah's GWPP, overseen by the UT DEQ - Division of Water Quality (UT DEQ-DWQ) for OUs 12 and 16. Remedial actions being implemented at OUs 12 and 16 are being overseen by UT DEQ-DWQ under the permit program to ensure that OU2 is not further impacted.

It is the intent of the Agencies that this technical memorandum will be used as reference under various site-wide and OU-specific management plans, to ensure the mining impacted soils and groundwater are effectively managed until such time that unrestricted use/unlimited exposure action levels are attained. The action levels listed in the two attachments are amendable by the Agencies premised on further risk assessment and risk management decisions, or recommendations by UT DEQ-DWQ.

Notes for Site Wide Summary of Soil Action Levels for Kennecott North and South Zones

† The table provides a listing of the action levels for various metals of concern which can be found in soils located in the operable units of the Kennecott South and North Zones. The table provides concentration levels (or percentage values) to compare against soil characterization results. If a particular land use action level is exceeded, then, prior to redevelopment a person will have to undertake action to assess and/or mitigate the potential for exposure risk.

The term "action" may include but is not limited to: further site characterization, further site specific risk assessment, remedial/response action to mitigate exposure risk, implementation of institutional controls (ICs), and/or ongoing site management after development activities.

†† *The soil action levels listed in this table can only be used when comparing metals concentrations in soils/sediments collected from the operable units of the Kennecott South and North Zone.* As part of assessing the potential exposure risk caused by the listed metals of concern, certain variables specific to the Kennecott operable units were considered. These variables include, but are not limited to, the following: speciation and bioavailability of the metals of concern, the industrial processes that produced the specific mine waste with the metals of concern, and the types of specific land use activities that are likely to take place in each operable unit.

The listed action levels presented herein do not apply to other sites within the State of Utah located beyond the boundaries of the Kennecott operable units (except as otherwise explained below as it pertains to the site wide unrestricted land use action levels).

††† Default site wide (Kennecott South or North Zone) unrestricted land use action levels for arsenic (50 mg/kg), cadmium (70 mg/kg), lead (500 mg/kg), and selenium (390 mg/kg) have been derived for those portions of the site where a site specific, risk based, residential action level has not been established and for locations not modeled during the site specific risk assessments. Using default numbers for exposure parameters, conservative values for bioavailability and intake ratios under standard risk assessment and management methodology, the Agencies calculated the default unrestricted land use action levels. The unrestricted land use action levels are protective of public health for all land uses without restrictions, including relocation beyond the Kennecott boundaries. It is important to note, that while the arsenic, cadmium, lead, and selenium unrestricted land use action levels may be protective for a residential land use, they may not protective of other exposure scenarios (e.g., ecological risk).

Both the arsenic and lead unrestricted land use action levels are based on risk assessment and risk management methods. Due to possibility of contaminated media associated with mining and smelting operations and the uncertainty associated with the limited environmental information (i.e., bioavailability) these unrestricted land use action levels should be used when limited characterization data is available and potential off-site (meaning beyond the Kennecott boundaries) relocation is being considered. The arsenic and lead unrestricted land use action levels are derived from the September 2002 Record of Decision.

The cadmium and selenium unrestricted land use action levels have been calculated by using a residential exposure scenario based on the "Risk Assessment Guidance for Superfund (RAGS) part B" (http://www.epa.gov/swerrims/riskassessment/ragsb/index.htm). Also considered were the screening values that are found in the Regional Screening Levels Tables dated May 2014. The unrestricted land use action levels for cadmium and selenium are the residential RSLs.

[1] The listed industrial, agricultural, and recreational land use action levels are located in the document entitled, *Final Preliminary Remediation Goals Report for Addressing Risks to Human Health From Exposure to Chemicals in Kennecott Soils*, December 30, 1999. These action levels are applicable site wide, absent operable unit specific risk based concentrations listed in the November

Notes for Site Wide Summary of Soil Action Levels for Kennecott North and South Zones
1998, September 2001, and September 2002 Records of Decision.
[2] For Operable Unit #1, the residential and commercial action levels for lead (respectively 1100 mg/kg and 2000 mg/kg lead) are obtained from two documents: (1) U.S. EPA Region 8 June 1995 Action Memo for the Bingham Creek Phase III residential removal action, and (2) U.S. EPA Region 8 February 1993 Unilateral Administrative Orders to Kennecott and ARCO (CERCLA-VIII-93-10) for the Bingham Creek Channel removal action. The residential action level for arsenic (100 mg/kg) is obtained from the November 1998 Record of Decision for Operable Unit 1.
[3] For Operable Unit #3, the action levels for residential, day care and playground land use application are obtained from the September 28, 2001 Record of Decision. The arsenic and lead action levels for these land use applications are based on speciation and exposure pathways which were considered as part of the risk assessment performed for the City of Herriman.
[4] Commercial and Residential action levels for undeveloped areas within the Daybreak Master Planned Community were proposed by Kennecott Utah Copper in the May 26, 2006 Exponent document entitled *Evaluation of Cleanup Levels for Arsenic and Lead in Soil for Undeveloped Portions of the Daybreak Area* and accepted by the CERCLA Agencies in a letter dated September 22, 2006.
[5] The listed industrial, agricultural, and recreational land use action levels are located in the document entitled, *Final Preliminary Remediation Goals Report for Addressing Risks to Human Health From Exposure to Chemicals in Kennecott Soils*, December 30, 1999, and as modified in the *Record of Decision* dated September 28, 2001 for Operable Unit #3.
[6] The listed industrial, agricultural, and recreational land use action levels are located in the document entitled, *Final Preliminary Remediation Goals Report for Addressing Risks to Human Health From Exposure to Chemicals in Kennecott Soils*, December 30, 1999, and as modified in the *Record of Decision Kennecott North Zone Site/Kennecott South Zone Site*, September 26, 2002.
[7] The listed industrial, agricultural and recreational land use action levels are obtained from the document entitled, *Final Preliminary Remediation Goals Report for Addressing Risks to Human Health From Exposure to Chemicals in Kennecott Soils*, December 30, 1999. At the time of land use change, the location of a historic site needs to consider the operable unit specific applicable land use standards (listed in the November 1998, September 2001 and September 2002 Records of Decision) to ascertain if an operable unit specific risk based land use standard is applicable.
[8] There are discrete parcels located within the Bingham Creek Channel and in the Daybreak Commerce Park that were considered in 2006 to be part of the overall Daybreak Community. The May 26, 2006 Exponent document entitled *Evaluation of Cleanup Levels for Arsenic and Lead in Soil for Undeveloped Portions of the Daybreak Area* addressed the establishment of residential and commercial land use action levels for the Daybreak Community as defined in the Exponent document and represented herein on Figure 1-A. Though limited, site specific data from the portions of Bingham Creek Channel and the Daybreak Commerce Park areas (located within the Daybreak Community) were included in the risk assessment. The CERCLA Agencies in a letter dated September 22, 2006 accepted the proposed land use action levels for the Daybreak Community. Figure 1-B herein portrays those portions of OU1 which are subject to the residential and commercial land use action levels for arsenic and lead, for the Daybreak Community.

Notes for Site Wide Summary of Groundwater Action Levels for Kennecott North and South Zones

† *This table summarizing CERCLA selected action levels and State of Utah protection limitations for groundwater is intended for use only at the Kennecott South and North Zones where mining influenced groundwater is managed.*

[1] The action levels listed are derived from UAC R309-200-5 (State of Utah Primary Drinking Water Standards) and the June 2007 ESD for OU2. Review of the April 2014 remedial progress report determined that for the 2012 and 2013 data sets there were some samples of groundwater extracted from the Zone A acid plume which contained un-speciated chromium results in exceedance of the State Primary Drinking Water Standard. Thus chromium is added until it can be demonstrated that this standard is complied with throughout the entirety of the Zone A plume.

[2] The December 2000 Record of Decision denotes that EPA Region 8 was deferring the selection of a remedy for the Zone B Plume pursuant to the State of Utah's Natural Resource Damage project addressing the mining influence to the aquifer in Zone B. The project being implemented in Zone B pursuant to the 2004 NRD Three Party Agreement (as amended in 2009) is producing treated water (in compliance with municipal water quality standards) from extracted groundwater from the impacted aquifer in Zone B. The contaminant specific limitations listed are derived from R309-200-5 for reference purposes (and are applicable for the treated water).

[3] The action levels listed (or referenced) are pursuant to the selected remedies for these three operable units and the 1995 Memorandum of Understanding. Kennecott manages mining influenced groundwater (in part) under the requirements of the State of Utah Groundwater Protection Program.

[4] Pursuant to the Utah Groundwater Protection Program, to ensure the protection of the underlying aquifer, discharge limits for the following contaminants are listed in Table 1 of Permit #UGW350010: pH, Sulfate, TDS, Cd-D, Cu-D, and Zn-D. The compliance limits are established from background concentrations at each compliance well (pursuant to R317-6-4). The permit can be found at: http://www.waterquality.utah.gov/GroundWater/gwpermits/index.htm

[5] Pursuant to the Utah Groundwater Protection Program, to ensure the protection of the underlying aquifer, discharge limits for the following contaminants are listed in Table 2 of Permit #UGW350010: pH, Sulfate, TDS, Cd-D, Cu-D, and Zn-D. The compliance limits are established from background concentrations at each compliance well (pursuant to R317-6-4). The permit can be found at: http://www.waterquality.utah.gov/GroundWater/gwpermits/index.htm

[6] Pursuant to the Utah Groundwater Protection Program, to ensure the protection of the underlying aquifer, discharge limits for the following contaminants are listed in Table 3 of Permit #UGW350008 (Smelter): pH, Chloride, Sulfate, TDS, As-D, Ba-D, Cd-D, Cr-D, Cu-D, PB-D, Se-D, Zn-D; Table 1 of Permit #UGW350011 (Tailings Impoundment): pH, Sulfate, TDS, As-D, Ba-D, Cd-D, Cr-D, Cu-D, Pb-D, Se-D, Zn-D, Table 1 of Permit #UGW350015 (North Concentrator): pH, Sulfate, TDS, As-D, B-D, Cd-D, Cr-D, Cu-D, Pb-D, Se-D, Zn-D. The compliance limits are established from historical trends at each compliance well (pursuant to R317-6-4). The permits can be found at: http://www.waterquality.utah.gov/GroundWater/gwpermits/index.htm

[7] Absent the mining influence and naturally occurring elevated TDS at OU23, the aquifer represents a potential source of drinking water for nearby communities. Though a drilling restriction (to prevent the development of the aquifer as a source of drinking water) is pending, the State of Utah Primary Drinking Water Standards (R309-200-5) are relevant if the impacted aquifer is somehow developed as a source of drinking water in the future.

[8] Pursuant to R309-200-5 (1)(c)(2) & (1)(c)(3) the State of Utah Primary Drinking Water Standards for Sulfate (500 mg/L) and TDS (1000 mg/L) can be allowed by the Division of Drinking Water Board to be higher. As it pertains to sulfate, (1)(c)(2), if the primary standard is to be set to 1000 mg/L a supplier will demonstrate: (a) no better quality water is available, and (b) the water is not for human consumption from commercial establishments. As it pertains to TDS, (1)(c)(3), if TDS is greater than 1000 mg/L (i.e. 2000 mg/L), a supplier shall demonstrate that no better water is available.

Notes for Site Wide Summary of Groundwater Action Levels for Kennecott North and South Zones
[9] Pursuant to the Groundwater Protection Permit #UGW350015 DWQ has established a permit limitation for Dissolved Boron due to the storage and use of coal at the RTKC Power Plant. Refer to note 6 and the reference to Permit #UGW350015 therein.
[A] The OU2 selected remedy (Dec. 2000 Record of Decision) requires active ("A") cleanup of the Zone A plume (extract and treat) until it can be demonstrated that sulfate concentrations comply with the site specific action level of 1,500 mg/L and drinking water standards for metals are attained. Thereafter, a passive ("P") cleanup requirement (monitored natural attenuation) is to be used to document that sulfate concentrations comply with the State of Utah Primary Drinking Water Standard for sulfate of 500 mg/L. No TDS action level was established under the selected remedy.
[B] Pursuant to R309-200-5(5) the primary drinking water standard for arsenic is 0.010 mg/L as of January 23, 2006.
[C] Pursuant to UAC R309-200-5(2)(b) "the copper action level is exceeded if the concentration of copper in more than 10 percent of tap water samples collected during any monitoring period conducted in accordance with R309-210-6(3) is greater than 1.3 mg/L (i.e. if the 90th percentile copper level is greater than 1.3 mg/L).
[D] Pursuant to UAC R309-200-5(2)(a) "the lead action level is exceeded if the concentration of lead in more than 10 percent of tap water samples collected during any monitoring period conducted in accordance with R309-210-6(3) is greater than 0.015 mg/L (i.e. if the 90th percentile lead level is greater than 0.015 mg/L).

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times. All MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Shane Gambill

Abbreviations and Definitions

SDG	Sample Delivery Group.
MDL	Method Detection Limit.
RDL	Reported Detection Limit.
ND	Not detected at the Reporting Limit (or MDL where applicable).
U	Not detected at the Reporting Limit (or MDL where applicable).
RPD	Relative Percent Difference.
(dry)	Results are reported based on the dry weight of the sample. [this will only be present on a dry report basis for soils].
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.
Rec.	Recovery.

Qualifier	Description
J	The identification of the analyte is acceptable; the reported value is an estimate.
J6	The sample matrix interfered with the ability to make any accurate determination; spike value is low.

ESC Lab Sciences is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our "one location" design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be **YOUR LAB OF CHOICE.**
***** Not all certifications held by the laboratory are applicable to the results reported in the attached report.

Cooler Receipt Checklist

Client: HDRBID SDG# L851587

Cooler Received/Opened On: 8-5-2016 By: Richard Hughes

Temperature Upon Receipt: 3.9 °c

(Signature)

Cooler Receipt Check List	Yes	No	N/A
Were custody seals on outside of cooler and intact?	✓		
Were custody papers properly filled out (ink, signed, etc.)?	✓		
Did all bottles arrive in good condition?	✓		
Were correct bottles used for the analyses requested?	✓		
Was sufficient amount of sample sent in each bottle?	✓		
Were correct preservatives used?			✓
Were all applicable sample containers checked for preservation? (Any samples not in accepted pH range noted on COC .)			✓
If applicable, was an observable VOA headspace present?			✓
Non Conformance Generated? (If yes see attached NCF)	Ø	✓

9C-5 Drainage....6
9D. SUBMITTALS....6

TABLES

9C -1 Distress Trigger Values for Rigid Pavements 4
9C -2 Distress Trigger Values for Flexible Pavements 6

9—WARRANTY PROVISIONS

9A. GENERAL

Warrant the Work for the duration of the Warranty Period in accordance with the requirements of this Part 9 and Part 2 (General Provisions). Remove, replace, or correct Work at no cost to the Department when an element of Work does not meet Contract requirements.

Warranty Period. Except as specified otherwise within the Contract provisions, warrant the Work for two years after the date of Final Acceptance.

9B. STANDARDS

Not used

9C. REQUIREMENTS

9C-1 Geotechnical—Maximum Permissible Settlements

Warrant the maximum permissible settlements during the designated Warranty Periods as follows.

A. **Pavements**: As measured by a string line and/or from the as-designed roadway grade.

1. Transverse direction: 0.2 inch differential per 12-foot lane width
2. Longitudinal direction:
    a. Structure approaches: 0.5 inch differential per 25 feet
    b. All other locations: 0.3 inch differential per 50 feet
3. Total post-construction settlement: 1 inch

B. **Foundations Supporting Bridges**:

1. Total settlement: 1.0 inch, and maintain minimum structure height clearances
2. Differential settlement:
    a. Transverse across substructure unit(s): 0.2 inch per 12-foot width
    b. Longitudinal between adjacent foundation supports: 0.75 inch per 100 feet

C. Structure Approach Slabs

1. Longitudinal direction (parallel to roadway alignment): 1 inch differential per 25 feet
2. Transverse direction: 0.2 inch per 12-foor lane width

D. **Deep Foundations Supporting Walls**:

1. Total settlement: 1 inch
2. Differential settlement: 0.5 inch per 30 feet

E. **Mechanically Stabilized Earth (MSE) Walls**: The following maximum movements (all measured at the wall face) will be applied for the wall Warranty Period. The parenthetical entries are examples of the maximum allowable movements, typically

for the minimum length of measurement;

1. Differential Settlement (measured at wall face):
   a. Single-stage walls: 0.3% (1.8 inches per 50 lineal feet of wall)
   b. Two-stage walls, first stage (wire facing): 1.5% (3.6 inches per 20 feet of wall)
   c. Two-stage walls, second stage (panels): 0.15% (0.9 inch per 50 feet of wall)
2. Horizontal Alignment: 0.25% (0.9 inch per 30 lineal feet of wall)
3. Vertical Alignment: 0.25% (0.3 inch per 10-foot vertical segment of wall)
4. Overall Plumbness: 0.2% (0.45 inch for 20 foot height of wall)

9C-2 Pavement—Rigid and Flexible

A. Warrant that, during the Warranty Period, both the allowable level and extent of severity for the various distress types identified do not exceed those trigger values identified in Table 9C-1 (Distress Trigger Values for Rigid Pavements) and Table 9C-2 (Distress Trigger Values for Flexible Pavements) for the two pavement types. If any of these values is exceeded, take the recommended corrective action to bring these parameters within the limits.

TABLE 9C-1
DISTRESS TRIGGER VALUES FOR RIGID PAVEMENTS

Distress Type	***Allowable Severity***		***Corrective Action ****
	Level	***Extent***	
Cracking:			
Corner Break	Low Severity: Crack not spalled for more than 10% of the length of crack; no measurable faulting; and corner piece not broken into two or more pieces	Low Extent: 2 corner breaks per lane-mile	Repair full depth.
Durability "D" Cracking	Crescent-shaped hairline cracking, with no loose or missing pieces	Not allowed	Replace total slab.
Longitudinal Cracking	Low Severity: Crack widths <1/8", no spalling, and no measurable faulting; or well-sealed and with a width that cannot be determined	Low Extent: 4 slabs per lane-mile	If cracking exceeds low severity, replace full depth of slab. If two or more cracks per panel, replace full slab.
Transverse Cracking	Low Severity: Crack widths <1/8", no spalling, and no measurable faulting; or well-sealed and with a width that cannot be determined.	Low Extent: 4 slabs per lane-mile	Replace according to UDOT Standard Drawings, Section 450. If two or more cracks per panel, replace full slab.
Joint Deficiencies:			
Joint Seal Damage—Transverse	Low Severity: Transverse joint sealant damage, as described by the Strategic Highway Research Program (SHRP): extrusion, hardening, adhesive failure, cohesive failure, or complete loss of sealant	Low Extent: 10% of joint length per lane-mile	Reseal joint.

TABLE 9C-1
DISTRESS TRIGGER VALUES FOR RIGID PAVEMENTS

Distress Type	*Allowable Severity*		*Corrective Action **
	Level	*Extent*	
Joint Seal Damage—Longitudinal	Low Severity: Longitudinal joint sealant damage, as described by SHRP: joint sealant damage, extrusion, hardening, adhesive failure, cohesive failure, or complete loss of sealant.	Low Extent: 10% of joint length per lane-mile	Reseal joint.
Spalling—Longitudinal Joint	Low Severity: Spalls <3" wide (measured to center of joint) with loss of material; or spalls with no loss of material and no patching.	Low Extent: <5% of joint length per lane-mile	If severity is low, fill void with hot-pour sealant. If low severity is exceeded, repair to full depth.
Spalling—Transverse Joint	Low Severity: Spalls <3" wide (measured to center of joint), with loss of material; or spalls with no loss of material and no patching.	Low Extent: <5% of joint length per lane-mile or 25% of a joint.	If severity is low, fill void with hot-pour sealant. If low severity is exceeded, repair to full depth.
Surface Defects:			
Surface Crazing	(Not applicable)	Low Extent: <1% of surface area per lane-mile	Apply UDOT Standard Penetrating Seal.
Scaling	Deterioration of upper concrete surface	Low Extent: <1% of surface area per lane-mile	Apply UDOT Standard Penetrating Seal.
Map Cracking	Cracks that extend only into the upper surface of slab, compromising structural capacity	Not allowed	Replace total slab.
Polished Aggregate Damage	Surface mortar and texturing worn away	Low Extent: Skid resistance value <45 at end of 2 years	Abrade or grind surface to exceed established skid resistance values.
Popouts	Small pieces of pavement >1 inch in diameter broken loose from surface	More than 3 per square yard ($yd^{2)}$	Remove and replace with flexible repair material.
Miscellaneous Distress:			
Blowups	Not applicable; however, severity levels can be defined by ride quality and safety.	Low Severity: Within established ride quality and skid-resistance criteria, and a visual inspection	Within 24 hours, Department will perform temporary repair; within six months, Design-Builder must repair to full depth.
Faulting of Transverse Joints and Cracks	None allowed		If faulting of transverse joints occurs, replace the full depth of the slab.
Lane-to-Shoulder or Lane-to-Lane Dropoff; Lane-to-Shoulder or Lane-to-Lane Ramp Separation	Allowable: Maximum = ¼ inch; Mean width < ¼ inch.	2% of joint length per lane-mile	Retrofit No. 5 tie bars @ 3-foot centers; grind and overlay.

TABLE 9C-1
DISTRESS TRIGGER VALUES FOR RIGID PAVEMENTS

Distress Type	***Allowable Severity***		***Corrective Action ****
	Level	***Extent***	
Differential Settlement at approach slab/pavement interface	Allowable: Maximum = ½ inch	At any location	Slab-jack or remove and replace pavement panel
Patch/Patch Deterioration	None allowed		Replace to full depth.
Water Bleeding and Pumping	Seeping or ejection of water from beneath the pavement through cracks	Not allowed	Underseal slab and seal joint.
** All corrective action(s) apply to full width of paving pass for full length of distress, except as noted otherwise.*			

TABLE 9C-2
DISTRESS TRIGGER VALUES FOR FLEXIBLE PAVEMENTS

Distress Type	*Allowable Severity*		*Corrective Action **
	Level	*Extent*	
Cracking:			
Fatigue Cracking	Low Severity: An area of cracks with no cracks or only a few connecting cracks; cracks not spalled or sealed; pumping not evident	Low Extent: <5% of the wheelpath, defined as a 3-foot-wide pass centered 3 feet off the lane line each side per lane-mile	Repair to full depth and replace with similar section; in this case, "full depth" is the depth of the pavement section (including base courses).
Block Cracking	Low Severity: Cracks with mean width ≤¼"; or sealed cracks with sealant material in good condition and with a width that cannot be determined	Low Extent: <5% of surface area per lane-mile	Seal cracks and overlay.
Edge Cracking	Low Severity: Cracks with no breakup or loss of material	Low Extent: <10% of pavement edge per lane-mile	Seal crack.
Longitudinal Cracking	Low Severity: Cracks with mean width ≤¼"; sealed cracks with sealant material in good condition and with a width that cannot be determined	Low Extent: <10% of pavement edge per lane-mile	Reseal crack and overlay.
Transverse Cracking	Low Severity: An unsealed crack with mean width ≤¼"; or sealed cracks with sealant material in good condition and with a width that cannot be determined.	Low Extent: <100 cracks per lane-mile; no 3 cracks (no cracks??) within 50-foot stretch	Seal or reseal crack or joint and overlay.
Patching and Potholes:			
Patch/Patch Deterioration	None allowed		Repair to full depth.
Potholes	None allowed		Repair to full depth.
Surface Deformation:			
Rutting	<1/8 inch deep	Low Extent: <5% of traveled surface per lane-mile	Rotomill and overlay; determine cause (e.g., OGSC or full depth) and replace to that depth.
Shoving	<1/8 inch deep	Low Extent: <5% of traveled surface per lane-mile	Repair to full depth or Rotomill and overlay; determine cause (e.g., OGSC or full depth) and replace to that depth.
Surface Defects:			
Bleeding	Low Severity: An area of pavement surface discolored (relative to the remainder of the pavement) by excess asphalt	Low Extent: 2% of surface area per lane-mile	Surface-treat with plant mix friction course.

TABLE 9C-2
DISTRESS TRIGGER VALUES FOR FLEXIBLE PAVEMENTS

Distress Type	*Allowable Severity*		*Corrective Action **
	Level	*Extent*	
Polished Aggregate	Reduction in surface friction.	Low Extent: 2% of surface area per lane-mile	Surface-treat with plant mix friction course.
Raveling	Low Severity: Aggregate or binder beginning to wear away, but no significant progression yet; some loss of fine aggregate.	Low Extent: <2% of surface area per lane-mile.	Surface-treat with plant mix surface treatment.
Miscellaneous Distress:			
Lane-to-Shoulder Dropoff	Allowable: Maximum ¼"; and Mean width, <¼".	Low Extent: 5% of joint length per lane-mile	Restore shoulder elevation.
Water Bleeding and Pumping	Seeping or ejection of water from beneath the pavement through cracks	Not allowed	Seal or reseal.
Differential Settlement at approach slab/pavement interface	Allowable: Maximum = ½ inch	At any location	Slab-jack or remove and replace pavement
**** All corrective action(s) apply to full width of paving pass for full length of distress, except where noted otherwise.***			

9C-3 Lamps and Luminaires

Warrant all luminaires for 10 years.

9C-4 Pedestrian Bridge

Warrant the pedestrian bridge against defects in material and workmanship.

9C-5 Drainage

A. Warrant the quality and function of drainage features constructed under this contract for the duration of the Warranty Period.

B. Warrant the quality and function of irrigation facilities constructed under this Contract for the duration of the Warranty Period.

9D. SUBMITTALS

Provide submittals to the Department in accordance with Table 9D-1.

TABLE 9D-1
DESIGN-BUILDER SUBMITTALS FOR WARRANTIES

Submittal	*For Approval*	*Schedule*
Warranty Bond and Letter of Credit for Pavement Markings	No	Prior to Placing
